ACKNOWLEDGEMENTS

The Assessment Team would like to thank all those who provided information that made it possible to prepare this report. In particular, the Assessment Team would like to thank Bunagana Town Leadership, Management and staff of URA, MOWT, Bunagana Migration department officials, communities and opinion leaders where the One Stop Border Stop to be upgraded is located and the technical staff from NEMA.

EXECUTIVE SUMMARY

Introduction:

The Government of Uganda intends to implement a Great Lakes Trade Facilitation Project (GLTFP) focusing on improving regional infrastructure and facilities at the border posts, undertaking procedural reforms to facilitating cross border trade, promoting performance-based border management in cross border trade administration and ensuring effective communication, monitoring and evaluation. The project will support efforts for reducing nontariff barriers to intraregional trade, by improving regional environments for business and by supporting regional measures to improve governance. In addition, the project is designed to address underlying sources of conflict as well as poverty and underdevelopment at the Ugandan border with Democratic Republic of Congo (DRC), as well as contributing to the attainment of key regional commitments on Peace and Security. Cross- border trade will be used as a toll for stimulating and facilitating agricultural trade and increasing resilience and social cohesion. The project will be implemented with funding from World Bank.

Ministry of Works and Transport is in advanced stages of upgrading Bunagana Border Post facility in Bunagana Town Council, Kisoro District to better serve the business community and others in transit at this border point. The upgrade will involve establishing an additional block adjacent the existing office block, putting up a security fence, drainage system, driveways, new barrier among others.

The site for upgrade is bordered by Bunagana Town CBD along the eastern flank while Bunagana (of DRC) is located in the westerly direction. The immediate southern flank is characterised by Bunagana hill while an open area dotted with eucalyptus trees border the site to be upgraded in the northern neighbourhood.

It is envisaged that construction of the Border Post will increase efficiency at the border post thus reduce delays and subsequently improve livelihoods in border areas. It is projected to promote cross-border trade, strengthen economic interdependence and support regional peace and stability. It will enable comprehensive control of goods entering either country including controlled hazardous substances.

Project Activities during the Construction and Operation Phases

Landscaping of the area by levelling and stabilizing the site where to establish the additional office block construction of the additional building with the associated attributes, construction of the perimeter wall, drainage system, establishment of a new barrier, renovating the existing structures, re-designing the driveways and parking yards and connection to service utilities will be the major activities during the upgrade phase.

Major activities during the operation phase will be geared towards daily and periodic maintenance and upgrade of the buildings to ensure efficiency and minimise adverse effects to the environment. The facility will be handling both human and vehicular traffic on a daily basis hence will lead to generation of both liquid and solid waste among others that will require efficient management.

Design of the project and materials to be used

The proposed project will be comprising of Offices, Restaurants, Banks, residential rooms, open greenery, circulation roads, vehicle parking space, drainage system and security fence as the major components. It will bring the scattered offices and the ones lacking office space and currently housed under a tree as the UNBS under one roof.

vii

Raw materials required during the construction phase include water, ordinary sand, hard core and stone aggregate, gravel, cement and sand blocks, various types of iron bars, timber, tiles and corrugated iron sheets among others and will be accessed locally from private dealers/suppliers within and around the project area. Others not accessible from the immediate neighbourhood will be sourced from other areas of the country. The project is expected to be completed in 6 calendar months with a defect's liability period of 12 calendar months.

During the operation phase inputs required will include cleaning detergents, food items, drinks stationery and many more associated with facilities offering office/business and accommodation with associated attributes.

Project By-products

The major project by-products will be in form of generated solid waste and wastewater (effluent). The solid waste stream will include body waste, packaging materials, leftover food and paper (from the eating places, residential rooms and offices). Wastewater will be from the wash-ups of the facility and effluent from washrooms.

Project Cost: United States Dollars One Million, One Hundred Thirty-Five Thousand, Three

Hundred Thirty-Four and Sixty-Four Cents (US \$ 1,133,334.64) Only, inclusive of 18%

VAT (preliminary cost estimate)

Construction Period: 06 months (Feb to July 2020)

Defects Liability period

12 months

(Maintenance period)

Public Consultation and Disclosure

During the assessment, the consultant carried out a number of engagements with key stakeholders on the proposed project. This section of the report presents the objectives, process and the outcomes of the stakeholder engagement in the process of this ESMP. The key stakeholders that were engaged include Uganda Revenue Authority, Private Sector, specifically the Bunagana Cross Border Traders Association (CBTA) and Political leaders from the community and the district level.

viii

Section 6.2 of the report describes the key issues discussed with each of the stakeholders that were engaged in the preparation of this ESMP. For each stakeholder, the section shows the Venue, Time, date, participants and the key issues that were discussed during each engagement. Section 6.3 of the reports elaborates the key concerns from the consultations ad how they have been addressed in the ESMPs and the Project Design.

Project Benefits

The project is expected to employ a sizeable workforce during the re-construction phase and many more directly and indirectly when operational. Other benefits expected from the project include:

- Creating a modern facility that will increase efficiency at the border post thus reduce delays and subsequently improve livelihoods in border areas.
- The facility is projected to promote cross-border trade, strengthen economic interdependence and support regional peace and stability.
- Ensuring all offices are housed under one roof hence creating efficiency in cross border trade;
- Enabling comprehensive control of goods entering either country including controlled hazardous substances.
- Creating a modern facility offering space for offices, business and hospitality related activities currently yearned for by the stakeholders at the border;
- Provision of ample and safe car parking space hence contributing to traffic management at the border post once operational;
- Establishing a high value project unlike the current status today;
- Providing market for the raw materials and inputs to be used during the construction and operation phases;
- Contribution of revenue to Bunagana Town Council and national treasuries in form of taxes of various categories;
- Improvement of the aesthetic value of the area with a high value development facility in place with attributes currently lacking including convenient wash rooms, holding grounds for breast feeding mothers, provision of easy and convenient banking services, having all offices in the cross-border business sector under one roof; and
- Improved security in the project area since the development facility will be having security fence around the URA premises, security guards, sound barrier and better lighting system

Anticipated Construction Phase Impacts

Developments of this nature and magnitude have environmental impacts associated with them mainly during the upgrade/re-construction phase. The project is expected to have negative impacts during the construction phase and these are described in section 7.3 of this report. These shall include the following;

Soil Erosion

- Impact of Noise and Vibrations
- Impacts on Air Quality
- Poor Sanitary Waste Management
- Impact of Fuel and Oil Spills contamination
- Improper Management of Solid Waste (Construction Debris/ Demolition Waste)
- Degradation of Material Source Points
- Loss of secondary Vegetation cover
- Occupational Health and Safety during Construction
- Community Health and Safety during Construction
- Traffic interference and accidents
- Security
- Loss of working and boarding space

Anticipated Operational Phase Impacts

During the operation phase, a number of impacts are expected although these will mainly be minor and of low significance. The mitigation of these impacts is mainly dependent on the occupants and beneficiaries using the OSBP, which in case is Uganda Revenue Authority. The impacts expected in the operation phase shall include;

- Impact of poor solid waste management
- Pollution from wastewater from human occupancy
- Pressure on water consumption
- Pressure on energy consumption and control
- Likelihood of fire
- Pressure on neighbouring roads
- Possibility of Natural Disasters
- Likelihood of collapse of structure

Mitigation Measures

For all the mentioned anticipated impacts in both the construction and operational phases, the consultancy team proposed a variety of mitigation measures which should be implemented by the developer to avert the magnitude of the proposed impacts to a minor or negligible. In section 7.3 and 7.4, the consultant airs out each anticipated impact and then gives adequate description of the mitigation measures that can be implemented to avert each of the mentioned impacts.

In addition, section 7.5 of the report describes the key social impacts especially the Gender Based Violence (GBV) and Violence Against Children (VAC) that are likely to rise with the establishment of the BP. The consultant goes ahead to propose a grievance redress mechanism that can be implemented by the developer to ensure that grievances from communities are obtained and handled in a proper manner to ensure harmony of the project with the community.

Environmental and Social Management Plan

The responsibility of implementing an environmental and management plan lie with the implementing agency (MOWT, contractor, the supervising Engineers) and the primary users during the operation phase. An environmental and social management plan has been prepared for the re-construction and operation phases of the BP facility. It describes in details each of the mitigation measure to be implemented and whose responsibility for both phases. MOWT has the overall task of ensuring that the mitigation measures are implemented.

Conclusion and Recommendation

A number of environmental and social impacts will result from the establishment of this BP. Major issues of concern include; pollution due to dust, noise, oil leakages, sediments, increased storm water generation as a result of the paved surfaces, earthworks.

Sensitive issues have been identified, mitigation measures to address the issues recommended and an environmental management and monitoring plan suggested to allow best management practices within the construction and operation phases.

No alternative to the project was considered since the proposed development is suitable with the area land use and planning provisions however the project design was studied to ensure that it has put into consideration the safety and environmental aspects before execution of the project. Such included provisions for use by the physically handicapped, presence of fire escape routes, availability of adequate vehicle parking facilities commensurate with the commercial useable space available, provision for effective evacuation of generated wastewater, and suitability of the soil profile where to execute the project among others.

The area is characterised by institutional developments and other commercial undertakings as the proposed development which makes the project compliant with area land use and planning provisions. Guidance should be provided during the execution of the project to ensure it complies with the engineering, environmental and regulatory planning provisions.

The proposed commercial development is to be developed in an area zoned for BP development.

The project site is adequate enough to accommodate the proposed project in the current magnitude and general development safeguard measures have been proposed to ensure implementation of the project in harmony with the neighbourhood.

The proposed BP development process is environmentally and socially acceptable considering that this is a category three III process "Projects requiring environmental analysis" where the foreseen adverse impacts can easily be mitigated and the developer is committed to ensuring that implementation of this project does not cause injury to the environment. Care must be taken to ensure that the existing adjacent infrastructure including current Customs offices and staff residences are not interfered with but upgraded and the best engineering practises put to use.

The concerted view of the consultancy team is to allow the project to be implemented in the proposed way (design and magnitude) on condition that MOWT and the primary users' implements the identified mitigation measures and undertakes to monitor all the key areas identified in the report.

1 BACKGROUND INFORMATION

1.1 Introduction

The Great Lakes Trade Facilitation Project (GLTFP) is a 5-year regional project implemented by the governments of the Democratic Republic of Congo, the Republic of Rwanda, the Republic of Uganda, and the Common Market for Eastern and Southern Africa (COMESA). The main project objective is to facilitate cross-border trade by increasing the capacity for commerce and reducing the costs faced by traders, especially small-scale and women traders, at targeted locations in the borderlands. Total budget for the project is 26,000,000 USD over a period of 5 years (2016-2020).

The Government of Uganda intends to implement the Great Lakes Trade Facilitation (GLTF) project focusing on improving regional infrastructure and facilities at the border posts, undertaking procedural reforms to facilitating cross border trade, promoting performance-based border management in cross border trade administration and ensuring effective communication, monitoring and evaluation. The project will support efforts for reducing nontariff barriers to intraregional trade, by improving regional environments for business and by supporting regional measures to improve governance. In addition, the project is designed to address underlying sources of conflict as well as poverty and underdevelopment at the Ugandan border with Democratic Republic of Congo (DRC), as well as contributing to the attainment of key regional commitments on Peace and Security. Cross- border trade will be used as a toll for stimulating and facilitating agricultural trade and increasing resilience and social cohesion.

Since the project is to be implemented with funding from World Bank, a number of environmental and social safeguards have to be considered before and during the implementation of the project. The project is classified by the World Bank as a category B project and thus shall require environmental impact assessment to be carried out prior to commencement. In addition, the project shall comply to all the ten (10) environmental and social standards of the World Bank Environmental and Social Framework and in line with this, six (6) of these have been cleared and four (4) are under review pending.

Ministry of Works and Transport is in advanced stages of constructing a Border Post facility at Bunagana border in Bunagana Town Council, Kisoro District. It will be developed on part of the land currently housing URA offices, URA staff residences, open green area and the two loading and off-loading points. The proposed site for re- development is bordered by Bunagana Town CBD along the eastern flank, the highway to DRC and open land under a eucalyptus plantation in the northerly direction while open agricultural land located on a relatively steep hill is to the immediate southern flank. The western neighbourhood comprises of no-man's land, DRC border infrastructure including Bunagana town (of DRC).

The current set up comprises of scattered offices (customs, security, migration) including others housed under a tree which results in delays while serving the business community and those in transit to and from DRC/Uganda. To better serve the business community at the border, Government of the Republic of Uganda together with development partners mooted the Great Lakes Trade Facilitation Project which will see a BP established.

Putting in place the above-proposed development is likely to have both positive and negative impacts (Social – cultural and environmental) on the environment hence the need to undertake an assessment for the projects' aspects.

Section 20 (3) of the National Environment Statute, (NES) 1995 requires that all projects or policies that may, are likely to or will have significant impacts on the environment be subjected to EIA so that adverse impacts can be eliminated or mitigated. In addition, Environmental Impact Assessment (EIA), as a tool for better planning, permits the integration of environmental concerns into the project planning process at the earliest possible planning and design stages. The assessment will help in identifying, predicting and evaluating the foreseeable environmental and social impacts, both beneficial and adverse, with the view to eliminating where possible, or minimizing the negative impacts while optimizing the positive impacts.

Therefore, this assessment complies with Ugandan Statutory requirements; the National Environment Act (1995), and the Environmental Impact Assessment (EIA) Regulations (1998). These require a developer to submit to the National Environment Management Authority (NEMA) a project brief or an EIA depending on the level of effects of a project in question is likely to have on the environment.

By complying with the statutory requirements, this assessment will provide the developer with practical advice on the mitigation of any potentially adverse environmental impacts of the project.

1.2 Objectives of the Environmental Management and Social Assessment

The overall objective of the study was to identify possible environmental and social impacts resulting from the establishment of the BP in this location and to ensure that the environmental considerations are incorporated into the project implementation plan before the pre-operational stage.

Other specific objectives were:

- To establish the baseline conditions in the project and their surrounding environments and assess how these conditions will be affected by the proposed project on one hand and how the conditions will affect the project on the other hand;
- To identify and assess the magnitude and duration of both positive and negative impacts resulting from the implementation and operation of the project;
- To promote public consultations amongst stakeholders so as to assess the acceptability of the project; and
- Compile an environmental and social management Plan of the project to assist in the decisionmaking process and serve as a basis for future environmental monitoring of the project – offer guidance.

1.3 Scope of this Assessment

The study covered all the principal areas which included:

- Location study e.g. suitability of proposed site vis-à-vis adjacent land-use, any risks to sensitive
 ecological, economic resources or to neighbouring communities and how these infrastructures
 will be altered by the proposed project;
- Significant impacts both positive and negative impacts;

- The Social-economic impacts of the proposed construction were assessed to determine the
 effect on the communities to be directly or indirectly affected by the project including positive
 attributes;
- The study identified measures of ensuring safety, avoidance of pollution, traffic accidents and interference with existing infrastructure in the project area as a result of the activities associated with the construction of the BP;
- Mitigation measures to combat and monitor the critical negative environmental impacts during the project implementation phase were outlined;
- Technical soundness and validity of the contents of the environment social assessment was
 ensured in addition to ensuring that the study conformed with the requirements of the national
 and sectoral guidelines; and
- As a requirement for any EIA in Uganda, the study was carried out in close consultations with all the relevant stakeholders including lead agencies and the communities to discuss public concerns of the intended BP.

1.4 Methodology

The proposed project was a comprehensive assessment that had to be well organised and structured in order to achieve the stated tasks in the terms of reference. Several approaches were used including; document review, site visits and/or observation and interviews.

1.4.1 Document Review

Documents readily available relating to BP in general and the site catchment areas in particular were reviewed. These included project reports and area development plans among others.

1.4.2 Site Visits and Observation

The whole area of the proposed project was examined by a walk-through tour with a view to assessing the likely impacts as a result of project implementation. This enabled the consultants to physically make professional observation of the physical environment in addition to other environmental attributes likely to affect or be affected by the implementation of the project.

As a result of site visits and observation, consultants were able to triangulate findings from documents reviews, identify land use patterns, vegetation cover, population densities, settlement patterns and prevailing economic undertakings.

1.4.3 Questionnaire

Questionnaires were administered to two categories of respondents i.e. the technical people or professionals from relevant agencies and the local communities around the project site where the BP project is to be established.

1.4.4 Public Consultations

The consulting team held consultative meetings with URA, Bunagana (Uganda & DRC town officials) and community members.

It is most important that people are aware of the impending developments more so when it involves their neighbourhood. Local communities have knowledge of their natural, physical, cultural and social environment and therefore best placed to assist in the identification of likely environmental and social issues in addition to proposing practical solutions for any adverse impacts. Advance warning of the likely project impacts allows the communities to plan for any likely eventualities especially if it is to lead to change of life styles.

Issues discussed centre on aspects of the projects like noise and dust pollution, loss of working space, likely traffic accidents, long distances to access construction materials, waste management, and employment among others. Positive attributes were also discussed during these consultations.

1.4.5 Expert and Scientific Data Analysis

Scientific data collection and analysis was carried out around the area of influence. Of great concern was how the activities will relate to the area biodiversity.

1.4.6 The Consulting Team

The survey team was composed of the core consulting team, which was the policy and technical organ of the assessment responsible for the direction of the study. It was composed of core consultants from different professional specializations headed by a team leader. The consultants pooled together their varied expertise and experiences to be able to accomplish this assignment.

1.4.7 Structure of this Assessment

The remainder of this Assessment is divided into the following principal sections:

Chapter 2 deals with the legislation taken into consideration that has a bearing on this project;

Chapter 3 provides a general outline of the existing environment in the area of the proposed project;

Chapter 4 describes the proposed BP project components during the construction and operation phases;

Chapter 5 presents analysis of project alternatives: the no action versus the proposed development;

Chapter 6 deals with Public Consultations and Disclosure;

Chapter 7 deals with environmental impacts associated with the construction and operation phases of the project;

Chapter 8 deals with mitigation measures for adverse impacts (analyzing each aspect of the environment in detail, providing an account of baseline conditions, prediction and evaluation of the impacts of the project; evaluation of significant environmental and social impacts);

Chapter 9 comprises an Environmental and Social Management Plan identifying the measures to be adopted during the operational life of the projects to ensure their environmental acceptability to minimise any adverse impacts and provide for appropriate environmental monitoring.

Chapter 10 puts across main findings, recommendations and conclusion

2 POLICY, LEGAL AND INSTITUTIONAL FRAMEWORK

2.1 POLICY, LEGISLATION AND REGULATORY CONSIDERATIONS

Environmental Studies are a legal requirement and should be carried out for all proposed developments that are likely to have significant environmental impacts so that any negative impacts can be minimized or eliminated. This environmental study that addresses the proposed Bunagana BP project, falls under the third schedule of the NEA 1995 (category 2): Urban Development-establishment {development of shopping centres and complexes}, hence the need to call for an assessment to report to conform to the regulatory requirements. The policies and regulations applicable to environmental and social management with respect to the construction works are:

2.2 POLICY(S)

2.2.1 The National Environment Management Policy, 1994

Its overall goal is the promotion of sustainable economic and social development that enhances environmental quality without compromising the ability of future generations to meet their own needs. The policy clearly states that an EIA should be conducted for any policy or project that is likely to have significant adverse impacts on the environment.

2.2.2 The National Land Policy 2013.

The objectives of this National Land Policy are to among others to stimulate the contribution of the land sector to overall Social-economic development, wealth creation and poverty reduction in Uganda, ensure sustainable utilization, protection and management of environmental, natural and cultural resources on land for national Social-economic development and ensuring planned, environmentally-friendly, affordable and orderly development of human settlements for both rural and urban areas, including infrastructure development. Development of an ESMP for the BP rhymes well with the objectives of the land policy.

2.2.3 Uganda Gender Policy

The policy aims at establishing a clear framework for identification, implementation and coordination of interventions designed to achieve gender equality and women's empowerment in Uganda. It is a guide to all stakeholders in planning, resource allocation, implementation and monitoring and evaluation of programmes with a gender perspective. Specifically, the policy among others aims at reducing gender inequalities so that all women and men, girls and boys, are able to move out of poverty and achieve improved and sustainable livelihoods, increase knowledge and understanding of human rights so that they can identify violations, demand, access, seek redress and enjoy their rights.

This is in line with the undertaken ESMP

2.3 THE LEGAL AND REGULATORY FRAMEWORK

2.3.1 The Uganda Constitution (1995)

The Uganda Constitution of 1995, Articles 39 and 41 provide that everyone has a duty to maintain and enjoy a sound environment. Every person in Uganda has a right to a clean and healthy environment and as such can bring action for any pollution or disposal of wastes. It states that government will promote development, utilization and public awareness of the need to manage land air and water resources in a

balanced and sustainable manner for present and future generations. The constitution vests all land in the country in the citizens of Uganda, and protects property and other individual rights. The government, or local government, may acquire land in the public interest, subject to provisions of Article 26 of the Constitution. This gives every person in Uganda the right to own property, and stipulates that the land or property cannot be compulsorily acquired unless prompt, prior and adequate compensation has been paid to the owner of the land/property.

2.3.2 The National Environment Act (1995) and Regulations

Section 19(1): This provides for a developer of a project described in the third schedule to this Act to submit a project brief to the lead agency, in the prescribed form and giving the prescribed information. Where a project/an activity is out of character with its surroundings; any structure of a scale not in keeping with its surroundings; and likely to lead to changes in land use an EIA should be conducted. The EIA Regulations specifies the projects to be subjected to EIA. These are:

- Where an environment impact review shall be required for small scale activities that may have significant impact;
- Where environmental impact evaluation for activities that are likely to have significant impacts; and
- Where environmental impact study for activities that will have significant impacts

Third schedule of the EIA regulations lists Urban Development-establishment **{development of shopping centres and complexes}** as requiring EIA's.

2.3.3 The National Environment (Waste Management) Regulations (1999)

Section 5 provides for a person who owns or controls a facility or premises, which generate waste, to minimise the waste generated by adopting cleaner production methods.

Subsection 1(b)(i): identifying and eliminating potential negative impacts of the product/waste.

(c): incorporating environmental concerns in the design and disposal of a product. Section 12 provides that a facility shall not discharge or dispose of waste of any state into the environment, unless the waste has been treated in a treatment facility and in a manner approved by a lead agency in consultation with the b9hauthority. "Developments of this nature normally generate huge amounts of solid & liquid wastes from offices, residential rooms and washrooms hence appropriate measures must be put in place for effective and timely disposal. The planned sanitation and drainage system are aimed at ensuring that the facility operates in a harmonious coexistence with the environment".

2.3.4 The National Environment (Standards for Discharge of Effluent into Water or on Land) Regulations, S.I. No 5/1999

Section (1) requires every industry or establishment to install at its premises, anti-pollution equipment for the treatment of effluent chemical discharge emanating from the industry or establishment. And **section (2)** calls for that anti-pollution equipment installed, under regulation (1) to be based on the best practicable means environmentally sound practice or other guidelines as the Executive Director may determine.

Considering the effluent to be generated from the BP and where it will eventually be discharge, this regulation has to be taken into consideration. The regulation provides for standards (maximum permissible limits) for effluent or waste water before discharge into water or on land a general obligation to mitigate pollution, and duty to keep records of amount of waste generated and parameters of the discharge.

2.3.5 The National Environment (Noise Standards and Control) Regulations, 2002

The regulation provides standards for:

- The maximum permissible noise levels to which a person may be exposed from a facility, activity or construction site;
- Control of noise and for mitigating measures for the reduction of noise levels; and giving effect to the provisions of section 29 of the Act.

Regulation 6 (1) provides that the maximum noise levels to which a person may be exposed from any area and shall not exceed the level specified in Column 2 of Part 1 of the First Schedule.

Regulation 7 (1) No person shall emit or engage in any activity that emits or is likely to emit noise in excess of the permissible noise level specified in regulation 6, unless permitted by a license under these Regulations.

(2) Any person who emits or engages in any activity that emits or likely to emit noise above a maximum permissible level specified in sub-regulation (1) commits an offence.

Section 8 (1) Duty to control noise; It shall be the duty of the owner or occupier of a facility or premise or machinery, to use the best practicable means of ensuring that the emission of noise from that machinery, facility or premises does not exceed the permissible noise levels.

Sub-regulation (3) a person or occupier of a premise or facility or machinery or plant generating noise who fails to comply with this regulation commits an offence.

"This Act is greatly applicable in the case of the proposed commercial development to ensure protection of both the workforce and neighbours from exposure to excessive noise levels during construction and operational phases of the project. To this effect, the appropriate measures include provision of protective gear to the work force during construction such as ear muffs, having a noise reduction facility fitted to the standby generator to be used in case of power failure and limiting construction activities to daytime only when impacts of noise are least felt".

2.3.6 The Environmental Impact Assessment Regulation 1998

The Environmental Impact Assessment Regulation, 1998 (Statutory Instrument No. 13/1998), an EIA shall be conducted in accordance with terms of reference proposed by the developer in consultation with the authority. As per section 12, public participation is a requirement. In course of this study local communities and stakeholders have been widely consulted about the project for their views on the effects and benefits of the proposed facility. The photographs and list of persons consulted and their views and responses by the developer are contained within the section on Public Consultations and Disclosure.

2.3.7 The Land Act (1998)

Section 43 provides that whoever owns land or occupies land shall manage and utilize it in accordance with the Forest Act, the Mining Act, the National Environment Act CAP 153, the Water Act (1995), Uganda Wildlife Act (1996), and other laws.

Section 46 requires use of land to conform to the provisions of the law relating to Town and Country Planning Act and any other law.

"Before any development project is approved for implementation, plans must first be submitted to BTC for regularization to ascertain whether the intended development conforms to the planning provisions of that particular zoned area in line with this piece of legislation. The proposed development project in question rhymes with the area planning provisions and the planned submission of the plans to BTC for regularization and approval is in conformity with the urban planning provisions".

2.3.8 The Roads Act 1964

The act stipulates that no person may, without the written permission of the road authority erect any building, plant any tree or permanent crops within the road reserve, subject to any order made under this Act. Under the Roads Act 1994 the Minister may declare by statutory instrument an area bounded by imaginary lines parallel to and distant not more than fifty feet from the centreline of any road to be road reserve. "This Act is applicable in the case of this particular development project since it is located along the highway to DRC and accordingly extra care should be taken not to encroach on the road reserve during construction phase. The project should limit activities to the proposed site as indicated on the development plans. The proposed site is big enough to accommodate all the proposed project components".

2.3.9 The Town and Country Planning Act. CAP 30

The Act provides for the orderly planning of urban settlements and the countryside. Plans for all intended development projects must first be submitted to BTC for regularisation and approval before implementation starts in line with the Town Council Planning provisions. "For the case of this particular proposed project, structural/architectural plans should be submitted to BTC as per the provisions of the above-mentioned legislation for regularisation and approval before embarking on project implementation. The project in question rhymes with the area planning provisions".

2.3.10 Occupational safety and Health Act, 2006

The Act replaces the Factories Act of 1964 and encourages technical measure to ensure safety of workers at work place through a preventive approach. The Act provides for protection and prevention of all people at all workplaces from injuries, death, diseases and damage of property. Unlike the factories Act that emphasized workplaces mainly, this Act extends to all employment places to include both the workers and any other persons at that workplace at the time. Employers are supposed to ensure the safety of their workers, provide protective gears and a clean environment on top of all basic facilities like sanitary facilities.

Section 13(1) declares it the employer's responsibility to undertake such measures at his/her own cost to clear working environment free of any hazard due to pollution and (2) specifies some of the duties like provision and maintenance of plant and systems of work, arrangements to ensure and absence of

risks to health, adequate information instructions among others regarding occupational health and provision and maintenance of access and exits from workplace that are safe.

"This Act is greatly applicable in the case of this proposed development to protect both workers and site visitors together with tenants and/or occupants during the operation phase".

2.3.11 The Public Health Act

The Act consolidates the law in the respect of Public health and places duties on the Urban and local authorities in matters pertaining to public Health. It provides for measures to minimise water, air and noise pollution and empowers local authorities to take lawful, necessary and reasonably practicable measures for the prevention of any pollution dangerous to health of any supply of water, which the public within its district has a right to use, and does use for drinking or domestic purposes. The Public Health Act seeks to protect health of all citizens including the health of the environment through stipulation about drainage and safety of buildings and activities.

2.3.12 The Physical Planning Act Cap 281

The physical planning act, 2011 establishes district and urban physical planning committees. It provides for making and approval of physical development plans and applications for development.

Section 37 of the Act requires an EIA permit for developments before they are implemented, stating: "Where a development application related to matters that require an environmental impact assessment, the approving authority may grant preliminary approval subject to the applicant obtaining an EIA certificate in accordance with the National Environment Act".

"BTC has jurisdiction over this proposed site and therefore has regulatory control to ensure that this project conforms to local physical planning requirements. In the case of this proposed development project, plans should be submitted to BTC for regularization and approval pursuant to the provisions of this Act."

2.3.13 The Local Governments Act, 1997

This act provides for a district-based system of local governments. This system provides for elected councils that have both legislative and executive powers. Thus, the district councils play an important role in land administration, land surveying, physical planning, and management of forests, wetlands, environment and sanitation and road services that are not the responsibility of the central government. They are therefore charged with the crucial role of sensitisation and mobilisation of the local communities.

2.3.14 The penal Code Act cap.120

In section 176, 177, it creates offence against pollution and adulteration of air, water as well as noise pollution. This calls for the BP to take precaution and mitigate any likelihood to foul air or water in the surrounding environs in compliance of set standards.

2.3.15 The Investment Code of 1991

In Section 18(2(d), the code makes it an implied condition of every investment license to take necessary steps to ensure that the operation of his business enterprise do not cause injury to the ecology or

environment. This calls for the BP to take precaution and mitigate any likelihood injury to the ecology or environment.

2.4 International and Institutional Framework

2.4.1 The Universal Declaration of Human Rights1948

The UDHR is the foundation upon which the international system for protection and promotion of human rights has been built.

The Declaration is handy with the establishment of this proposed project. It puts emphasis of human rights where Article 17 (1) Everyone has the right to own property alone as well as in association with others. (2) No one shall be arbitrarily deprived of his property. *Applicable measures or rightful ownership are required to be taken without violating any of the party's rights.*

2.4.2 The Convention on Biological Diversity (CBD), 1992

This international legally binding treaty has three main goals (1) conservation of biological diversity, (2) sustainable use of its components; and (3) fair and equitable sharing of benefits arising from genetic resources. The document is seen as a key tool for sustainable development which among the many issues dealt with includes Impact assessments and Education and public awareness.

It is so relevant in this case to internationally support Impact assessments before projects commence to avoid adverse effects to biological resources in Uganda

2.4.3 The United Nations Convention to Combat Desertification in Those Countries Experiencing Serious Drought and/or Desertification, Particularly in Africa, 1994

Convention to combat desertification and mitigate the effects drought through national action programs that incorporate long-term strategies supported by international cooperation and partnership arrangements. Uganda is a party to this legally binding Convention that came to force in 1996. *This therefore calls for precautions by the proposed project to avert draught causing activities.*

2.4.4 Rio declaration on Environment and Development, 1992

This is not a legally binding tool; however, it offers a number of guiding principles that emphasize sustainable development, public participation especially women, use of indigenous knowledge and the polluter pays and precautionary principles during development proposals.

Principle 17 states that Environmental impact assessment, as a national instrument, shall be undertaken for proposed activities that are likely to have a significant adverse impact on the environment and are subject to a decision of a competent national authority. This adequately supports the need for EIA's for projects like this in order to safe quard man's interest and nature.

2.4.5 The United Nations Framework Convention on Climate Change (UNFCCC) On June 12, 1992, 154

Uganda upon ratification committed a voluntarily to "non-binding aim" to reduce atmospheric concentrations of greenhouse gases with the goal of "preventing dangerous anthropogenic interference with Earth's climate system" with other signatories who agreed in general that they would recognize "common but differentiated responsibilities". However, the Kyoto Protocol calls upon signatories to cut

emissions/pollution through various measures such as energy efficiency, protection of carbon sinks and the like. The convention is of relevancy to the establishment of the BP which is so energy intensive and produces carbon emissions. With that in mind, the developers will have to devise ways to reduce the likely negative impacts related.

2.4.6 Environmental & Social Safeguards

The primary role of Environmental and Social Safeguards are to protect people and environment from adverse impacts, reduce and manage risk ensure a sound and sustainable development. The triggered safeguards as far as Bunagana site is concerned include:

OP/BP 4.01 Environmental Assessment, OP 4.04 Natural Habitats, and OP 4.12 Involuntary Resettlement

This safeguard is concerned with ensuring that projects proposed for Bank financing are environmentally, socially sound and sustainable, inform decision makers of the nature of environmental and social risks and increase transparency and participation of stakeholders in the decision-making process. This ESMP has been prepared in compliance with this requirement.

OP/BP 4.01Environmental Assessment

This safeguard is concerned with ensuring that projects proposed for Bank financing are environmentally, socially sound and sustainable, inform decision makers of the nature of environmental and social risks and increase transparency and participation of stakeholders in the decision-making process. This ESMP has been prepared in compliance with this requirement.

OP 4.04 Natural Habitats

This is aimed at safeguarding natural habitats and their biodiversity, avoid significant conversion or degradation of critical natural habitats and ensuring sustainability of services and products which natural habitats provide to human society. Though it was among the safeguards triggered by the project, on ground assessment established that there is no natural habitat to be impacted on.

OP 4.12 Involuntary Resettlement

This safeguard aims at minimizing displacement, treat resettlement as a development program, provide affected people with opportunities for participation, assist displaced persons in their efforts to improve their incomes and standards of living, or at least to restore them, assist displaced people regardless of legality of tenure and pay compensation for affected assets at replacement cost.

The project will be carried out on the area that is titled under the Uganda Revenue Authority (URA), which is free of any encroachers. Therefore, no individuals will be displaced and resettled due to the implementation of the proposed Border Post and thus, this safeguard will not be triggered by the project.

2.4.7 General World Bank Guidelines on Environment Health and Safety

The World Bank Guidelines on Environment Health and Safety provide guidance to users on Environment Health and Safety issues in specific industry sectors. It involves creating organized efforts and procedures for identifying workplace hazards and reducing accidents and exposure to harmful situations and substances. It also includes training of personnel in accident prevention, accident response, emergency preparedness, and use of protective clothing and equipment.

The guidelines offer guidance on development of safe, high quality, and environmentally friendly processes, working practices and systemic activities that prevent or reduce the risk of harm to people in general, operators, or patients in addition to creating a systematic approach to complying with environmental regulations, such as managing waste or air emissions all the way to helping site's reduce the company's carbon footprint.

These guidelines area relevant to the BP and will be put into consideration to ensure smooth execution of the project in a safe and environmentally sound environment

2.4.8 Uganda Vision 2040

Uganda Vision 2040 provides development paths and strategies to operationalize Uganda's Vision statement which is "A Transformed Ugandan Society from a Peasant to a Modern and Prosperous Country within 30 years".

It aims at transforming Uganda from a predominantly peasant and low-income country to a competitive upper middle-income country. The Vision 2040 is conceptualized around strengthening the fundamentals of the economy to harness the abundant opportunities around the country among which include geographical location and trade in addition to reviewing and strengthening the foreign policy to enhance collaboration in accordance with existing and future agreements, standards and protocols within the framework of East African Community, other regional blocs, African Union and global community, for the realisation of this Vision.

It also looks at directly investing in strategic areas to stimulate the economy and facilitate private sector growth as this proposed BP.

2.4.9 Ministry of Trade, Industry and Cooperatives

Ministry of Trade, Industry and Cooperatives is responsible for promoting trade and industry and cooperatives for the development of the country. This Ministry is to ensure expansion and diversification of trade, cooperatives, environmentally sustainable industrialization, appropriate technology, conservation and preservation of other tradable national products. The roles above are targeted at generating wealth to benefit the country socially and economically as this proposed BP.

2.4.10 Ministry of Water and Environment

The ministry is the institution responsible for the formulation of policies that govern environmental management in Uganda hence responsible for environmental issues in the country.

2.4.11 National Environment Management Authority

This is the principal agency in Uganda responsible for the management of environment and is charged with the coordination, supervision and monitoring of all activities related to environmental management.

2.4.12 The Uganda Land Commission

It is responsible for sustainable management of land in Uganda.

2.4.13 The Town and Country Planning Board

The board provides for the orderly planning in urban and rural areas. It defines building operations to include the making accessible of electrical installations and development in relation to any land.

2.4.14 The District Land Board

This **(Kisoro District Land Board)** is charged with the responsibility for land issues at the local government level.

2.4.15 Bunagana Town Council

The town council is charged with orderly planning hence clearance of development plans and guidance will primarily be the responsibility of this institution. However, at the time of the study, the town council was not yet operational.

2.4.16 Uganda National Roads Authority

The Highway to DRC is under the management of Uganda National Roads Authority hence authority to modify access to the site as per the proposed architectural plans will be granted by UNRA.

3 PROJECT AREA ENVIRONMENTAL BASELINE CONDITIONS

3.1 The Project Area Biophysical Environment

The site to be developed lies on the foothills of Bunagana hill in the newly gazetted Bunagana Town Council:

Table 2: Site Characteristics

Site & Neighbourhood	Existing Environment / Attributes
Site	Site measures 2.051 Ha
	Dotted with several buildings accommodating offices, residential units,
	generator house, unit and stores;
	Has open space under secondary/exotic grass;
	There several ornamental, exotic tree and food crop species;
	Connected to hydro power though not reliable and piped water
	Has coverage of MTN and Airtel communication networks;
	Hosts well paved two parking yards; one belonging to URA while the second
	belongs to UNRA;
	The site has no fence around it and the barrier is extremely weak;
Eastern Flank	Highway to DRC and CBD of Bunagana town
Western Flank	No-man's land and Bunagana town of DRC
Southern Flank	Open agricultural land and part of Bunagana hill
Northern Flank	All-weather road to DRC, open agricultural land leading to a eucalyptus
	plantation

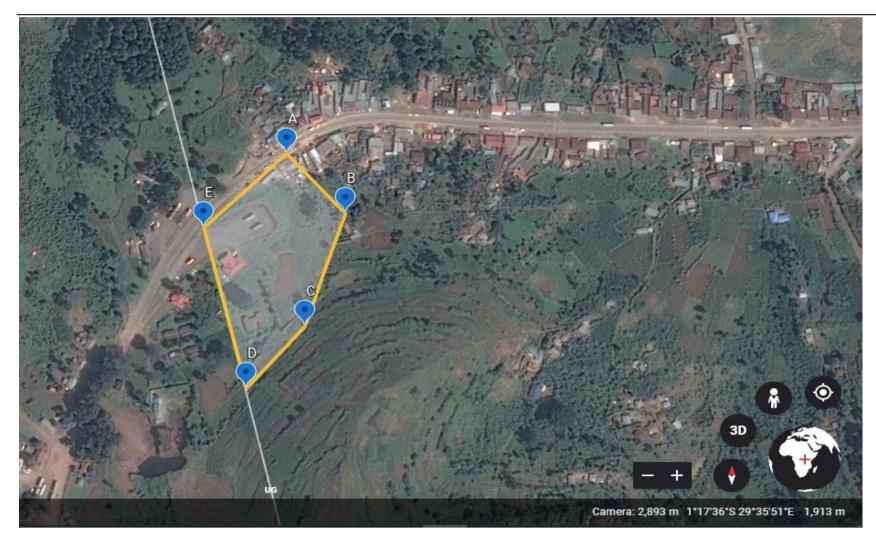

Figure 1: Google Map Portraying the Border Post for Upgrade and the immediate neighbourhood

other sister offices under one roof

URA Bunagana Customs office to be upgraded to accommodate Part of the site for development in its current status where major construction works will be undertaken

Figure 2: Photographs Portraying Project Site Current Status

Some of the infrastructure for upgrade; barrier

Figure 3: Current land use & Infrastructure on Site

Part of the site & the immediate western flank

The immediate eastern Flank; CBD of BTC

Figure 4: The immediate Neighbourhood; Western and Eastern Flanks respectively

Figure 5: The immediate Neighbourhood; Southern and Northern Flanks respectively

District level information has been used to a large extent while describing the area environmental baseline information.

3.2 Geology and Topography

The rocky system underlying most part of Kisoro District was influenced by the volcanic actions formed by the upsurge of the Western Rift Valley during the Pleistocene age. This is much eroded, altered and consists of the basement complex system. Kisoro District is underlain by three main rock systems, namely the Precambrian, Cainozoic and Mesozoic groups. The volcanic activity was characterised by the outpouring of a great variety of potash rich in alkaline lava.

The Kibaran organic complex consisting of folded and metamorphosed sedimentary sequence. Basement complex rock system occupies a large part of the District especially central Kisoro. It consists of metamorphic largely granitoid rocks, schist and foliated granites, granochiorate and adamellite. The high relief in the Sub- counties of Busanza, Chahi and Nyakabande are characteristics of highly weathered and exposed granite rocks. The Cainozoic rock system occupy the northern parts of the District and are traversed by Pleistocene series. These rocks comprise of sediments like alluvium, black soil and moraine.

The most striking geological influence on environment is the nature of volcanoes which comprise of volcanic ash with little amount of lava. Geology has had an important bearing on the geomorphological processes, topography and drainage. This in turn has influenced environmental processes and systems. This has many implications on environment and development for example due to very low proportions of coarse materials such as sand, murram and gravel, construction of buildings and roads is very difficult and expensive as materials have to be sourced from other districts (Mbarara).

The Volcanic actions were formed by the out pouring of a great variety of potash ash lava during upper Pleistocene age. These are found around Mufumbira Mountain region – Mountains Mgahinga, Muhavura and Sabyino. These mark the highest attitude on the Southern part of Kisoro District. Earthquake tremors are not a problem though sometimes they do occur. However, no major damages have been recorded.

Topography

Kisoro District covers a mountainous area which lies approximately 1981 m above sea level. It covers an area with two types of terrain namely: the lowland and the upland mountain landscapes (volcanic mountains). The highest point of the mountain is in the volcanic ranges bordering Rwanda in the southern part of the District and include: Mgahinga (3475 m), Muhavura (4127 m) and Sabyino (3645 m) above sea level. These volcanic ranges are interspersed by wide saddles with drainage valleys occupied by extensive swamps in Nyakagezi, Kabiranyuma and Kazibakye. These volcanic mountains are part of the six extinct/dormant and two active volcanoes of Virunga range extending into Rwanda and the Democratic Republic of Congo.

3.3 Drainage

The area around the BP is well drained because of being located on the footsteps of Bunagana hill in addition to the existing roadside drainage system that evacuates area storm water. The BP will have own drainage system in place to reinforce the existing constructed and natural storm water drainage system. Area storm is directed eastwards following the area natural landscape.

The District has crater lakes of Mutanda, Mulehe, Chahafi and Kayumbu. There is a network of permanent swamps many of which have been put under cultivation. The important swamps are Rugezi, Kaburanyuma and Nyakagezi which are located in the saddles between volcanoes of Muhavura, Sabyino and Mgahinga Mountains.

Volcanic Mountains of Virunga Ranges, Bwindi Impenetrable Forest and Echuya Highlands provide the important drainage systems in Kisoro District, the Eastern part of the Democratic Republic of Congo and Northern Rwanda. The drainage patterns of the mountain is radial with several rivers and numerous streams descending the mountain in all directions through V-shaped valleys and saddles between the volcanoes. This is present in some of the upland and mountain areas, major valleys are graded frequently as clay or silt floored and seasonally or permanently swampy and water-logged during wetter periods of the year. There is an underground drainage springing at Nkaka and Chuho.

3.4 Vegetative Cover

The natural vegetation of the district varies with the different ecosystems that characterise the area. It ranges from natural high forest through permanent swamps to grass savannahs and acacia savannahs, to post cultivation communities. Due to rapid increase in population and search for agricultural, residential and commercial land for development, there has been a lot of interference with the vegetation in the project area. What currently exist in the immediate proximity are agricultural gardens mainly Irish potatoes, beans, bananas, ornamental and fruit trees.

Kisoro District is dominated by mountains hence there is progressive change in vegetation zones as a result of physical factors in particular climate, altitude and edaphic. Different vegetation types cut across the District. These include forests, swamps and savannah vegetation in North, South and Central parts of the District respectively.

There are three main types of forests remaining in the District:

- High altitude forest (moist montane forest);
- Forest Savannah mosaic at high altitude; and

• Swamp forest.

3.4.1 High Altitude Forest (Moist Montane)

Moist lower montane forest zone is found in Bwindi Impenetrable Forest National Park at altitude 1500-2450 m above sea level and upper montane forest zone is a low forest type (15 m) with many tree species and is found at 3050-3300 m above sea level on volcanic mountains.

This forest is rarely pure stand but rather interspersed with bamboo at 2450-3050m altitude. This vegetation type has remained on the slopes of the volcanic mountain ranges - Mgahinga, Muhavura, Sabyino, Bwindi Impenetrable Forest National Park. The Bamboo (Arundinaria alpina) forest zone of Echuya Forest Reserve is found at exceptionally low altitudes of 22602450 m where it probably represents a colonising community once cleared by man. Montane bamboo forest varies in luxuriance from almost impenetrable thicket on the slopes of volcanic mountains, Bwindi Impenetrable Forest and Echuya Forest Reserve. Bamboo shoots provide 60% of Gorilla's food.

3.4.2 Forest and Savannah Mosaics

This vegetation cover is found at high, low to medium altitude 2100-3000 m above sea level. Trees are mainly remnants of previous moist montane forest with gradual links of savannah and wood shrubs patches at lower levels towards the central plains. This vegetation has been encroached on to expand land for agriculture and to harvest materials. Grass species abundant in this mosaic include Pennisetum purpereum, Hyperrhenia ssp. and Themeda triandra.

3.4.3 Swamp Forest

There are both permanent papyrus and reed swamps and seasonal swamps in water-logged areas. These are dominant in the central and northern parts of the District covering the Sub-counties of Chahi, Nyabwisheya and Nyakabande and in saddles between the volcanic Mountains of Mgahinga National Park (Rugezi, Kabiranyuma and Kazibakye swamps) and - in Mubwindi swamp (Kabale) which covers an area of 2 km2 in Bwindi Impenetrable National Park. Most of these swamps are dominated by Cyperus papyrus and reeds which attain height of 2-5 m. This vegetation is widely used for building and thatching.

3.4.4 Natural Forest, Reserve and Plantations

These are categorised as soft wood for fuel wood and poles, savannah woodland and natural bamboo forest of Echuya. Kisoro District has extremely rich and diverse natural forests which offer a wide range of habitats for species of fauna and flora. Natural forests like Bwindi Impenetrable Forest and Mgahinga Forest have been gazetted for conservation and made into National Parks except for Echuya Bamboo Forest (ca. 702 ha) which constitutes the scattered Cypress pine woodlots under the Forest Department. The rest of the woodlots are mostly Eucalyptus and are privately owned by individuals.

The site is devoid of significant vegetation cover save for the existing secondary vegetation that is periodically slashed, banana plantains in addition to a few ornamental and fruit trees.

3.5 Climate

3.5.1 Rainfall

Kisoro District like Kabale District experiences two rain seasons a year with heavy rains (peak rainfall) from March to May/June in which over 1500 mm rainfall is received and second rains are in August to October. November to February and June to August are dry seasons. The mean annual rainfall in the District is 1000-1250 mm. However, Mgahinga National Park and Bwindi Impenetrable National Park probably receive more rainfall than the central part of the District.

3.5.2 Temperature:

Kisoro District has a relatively low temperature where mean annual maximum temperature is 23°-25° C in the dry spell and mean annual minimum record of 10°-12.5°C.

3.5.3 **Soils**

Kisoro District has different soil types and this can be explained in terms of both geological and geomorphological processes which have a significance on soil formation.

3.5.3.1 Eutrophic Soils for Tropical Forest Region - Volcanic ash.

These are often rich in organic matter and sometimes saturated with bases to more than 50% of its exchange capacity. These soils are rich in plant nutrients and contain fairly high reserve of weatherable minerals usually developed on volcanic ash. Volcanic ash soils are found in the southern part of the District in the Sub-counties of Busanza, Muramba, Nyarubuye Nyakabande, Chahi and Nyarusiza around the Mufumbira Mountain ranges. The site is characterised by Volcanish ash soils.

3.5.3.2 Non-hydromorphic -Organic Soils of Mountains.

These are found at high altitudes and are almost entirely organic mountain soils. The upper layer contains more than 20% organic matter in the first 40cm. In Kisoro montane organic soils are predominant especially around Sabinio Mountain area. The organic soils are found in forests and mountains.

3.5.3.3 Papyrus Peat Soils

These comprise peat, sands and clays, developed on papyrus residues and river alluvium. Peat soils were formed as a result of accumulation of thick layer of organic matter r below swampy vegetation through slow decomposition, and these dominate swamps.

3.6 Social-economic Environment

Kisoro District covers the former Bufumbira County that formed part of Kigezi District and in 1991 it became Uganda's 35th district. It covers an area of 729.6 Km2 of which 662 Km2 is land and the rest is open water surface and swamps (National Biomass Study, 1995). Kisoro District is located in Southwestern Uganda region bordering with Rwanda in the South, Democratic Republic of Congo in the West and the Districts of Rukungiri and Kabale in the North and the East respectively. It lies between Longitudes 29° 35" and 29°.50" East and Latitudes 1°44" and 1°23" South. The District Administrative Centre is in Kisoro Town Council which is 510 Km South-west of Kampala City and 12 kilometres west of the site for development.

Kisoro was one of the former six counties of Kigezi District (Rukiga, Ndorwa, Rubanda, Kisoro, Rujumbura and Kinkizi). The District is mainly inhabited by Bafumbira, who share the same ethnic background with Rwanda Republic, some original citizens are Bakiga and other tribes from other parts of Uganda.

The major source of livelihood is subsistence farming, employment income and trading (cross border trading).

3.6.1 Land Tenure, Social Services, and Existing Infrastructure

The predominant land tenure in the area is leasehold tenure including part of the site for development. It already has connection to UEDCL power and NWSC piped water mains though both services are not stable/reliable. Communication services from MTN and Airtel telecommunication companies cover the project site.

3.6.2 Waste Management

Bunagana Town Council (though not yet operational) will be the institution charged with waste management in the area where this BP site is found. Currently solid waste is disposed of by burning. Informal means of solid waste management are used around the site.

3.6.3 Security

The area security is provided by several agencies that include The Uganda Police, Uganda Peoples Defence Forces, Local Defence Forces and private security firms. The BP uses both Uganda Police and Uganda Peoples Defence Forces for security services.

3.6.4 Water Supply

The area has piped water serving the town council and the immediate neighbourhood though not reliable. Much of the domestic water for use is obtained from Bunagana town of DRC. Nkaka water project being constructed by Government of Uganda and which will cover Bunagana Town Council was nearing completion at the time of the site inspection. Water harvesting is highly promoted in the area and is one of the major sources of domestic water during the rainy season.

3.6.5 Accessibility

The BP will be accessed from the all-weather Kisoro-DRC highway, which gives it an added advantage of easy access and convenient service delivery.

3.6.6 Tourist attractions

The major focus is Mountain Gorilla tracking at Buhoma and Ruhija. This is done with the assistance of Game Trackers, who are employed by the Park. It is believed that half of the world's population of Mountain Gorilla.

(300) is found in Bwindi Impenetrable National Park. The balance roams between the Democratic Republic of Congo, Rwanda and Uganda's Mgahinga National Park is part in Virunga conservation area (ca - 420 km2).

4 PROJECT CHARACTERISTICS

4.1 Introduction

This chapter presents a detailed description of the activities involved in the development of BP development. Major activities will involve site stabilisation, delivery of the required raw materials, construction of the additional building structure and landscaping after the construction works.

4.2 Project Activities

In order for this BP to successfully be developed and made operational, a number of activities will be carried out on site as indicated below.

4.2.1 Preparation Phase

The proposed project site for establishment of the BP belongs to Uganda Revenue Authority (URA) and will be the main beneficiary of the project since they will be getting a better structure. On their property, URA has other structures, some are occupied and some are empty. During this phase, there will be relocation of the staff and URA offices from the existing structure, to the other empty structures on the land to allow the redevelopment to take place. In relocation, URA shall not affect any other operating entities since they will be taking up space in the available empty structures and after redevelopment, they will relocate back to the new improved structure.

4.2.2 The Construction Phase:

The following will be undertaken during the construction phase to put in place an operational BP:

- Camp site set up with associated attributes;
- Site Preparation; and
- Construction of a commercial services building, toilet block and modification to the existing customs building into Immigration/Public Health facility.

4.2.3 The Operational Phase:

Major activities during the operational phase will include daily inspection and clearing of goods and raw materials traded across the border, clearing of people in transit to either country, maintenance of machinery and the buildings to ensure efficiency and minimise adverse effects on the environment.

Several people will be directly employed at the premises in addition to those in transit whose hygiene, occupational health and safety aspects at work will be of concern to the facility management. Details are indicated here below;

4.2.3.1 BP effluent Management

Given the level of anticipated human traffic, there are concerns regarding BOD, COD and nutrient loads of discharged effluent. The pH levels can be greatly influenced by cleaning agents used. Considering the nature of the terrain, several septic tanks and soak pits will be used in the management of facility wastewater to be generated (mainly domestic effluent).

4.2.3.2 Energy Consumption

The facility energy sources will be UEDCL electrical power tapped from the 3-phase line in its neighbourhood, which will be stepped down by a transformer for use in addition to other sources as solar power and standby generators for power backup.

4.2.3.3 Solid Waste Management

Significant quantities of solid waste will be generated from the facility. On top of the domestic waste which will be handled using coded bins, packaging material will be generated from the facility among others which will require effective and efficient management. Most of the generated solid waste (not hazardous will be disposed of onto the town council dumping ground to be identified. However, the short-term solution will be to have a contractor who will dispose it off at the dumping ground currently being used by Kisoro Town Council.

4.2.3.4 Fire hazard prevention

The BP will have an elaborate fire hydrant system, with the infrastructure in place and ready for use in case of an emergency handling. A Fire base unit with a standby generator, water tank farm and foam tanks connected to the fire hydrant system will be well positioned within easy reach in case of any eventuality. There is a fire station (comprising of a firefighting truck) based at Kisoro Police Station 12 kilometres away in the easterly direction.

4.2.3.5 Provision of Emergency/safety support systems

Management of the BP will ensure periodic upgrading of the safety support systems. These include the firefighting equipment, Fire policy details and assembly points gazetted, ensuring that the escape routes are always free of any obstacle all the time. The entire buildings will be fitted with smoke detectors and fire alarms that will periodically be checked and serviced to ensure effective performance.

Lightening arrestors will be in place before operation of the BP and guiding signages and educative materials on what to do in case of an emergence will be made available and in an understandable language. Regular painting of the interior with fire resistant paint will be undertaken. There is provision for an automated standby generator in case of power outage.

4.2.3.6 Periodic upgrading of the energy, water supply and sanitation systems and other components

One of the areas that are likely to cause great injury to the environment if not addressed well is the sanitation and energy systems at the BP. Major activities to this effect will be geared towards periodic upgrading of the energy systems to avert any would be fire occurrence from electric short circuits and audit areas of energy wastage to conserve better.

Efforts have to be made to ensure water availability all the time through provision of reservoir tanks. Roof water will be harvested and properly directed to tanks and any excess directed to the drainage system north of the development. Water supply is expected to stabilize once the Nkaka water supply project is completed and extended to the town council.

Sanitation is a crucial factor in the management of developments of such magnitude. Effective collection, storage, disposal of all wastes and in housekeeping will be given priority and periodically undertaken. Management of the BP will acquire several garbage bins for storage of the different types of wastes to be generated. Contracted firms will ensure effective and efficient maintenance of the complex sanitation system. Maintenance of the waste water system will be undertaken to ensure that there isn't any leakage.

Proper maintenance of the physical structures and the refurbishing of the entire BP will be among the regular activities that will be carried out during the operation phase.

Additionally, continuous maintenance of the landscaped gardens after construction works will be ensured for aesthetic and environmental sustainability.

During operation, a worker's policy will be made availed by management of the BP to guide activities and operations of the BP.

5 ANALYSIS OF ALTERNATIVES

Analysis of project alternatives in Environmental and Social Impact Assessment process should consider other practicable strategies that will promote the elimination of negative environmental and social impacts identified. It is a requirement to have alternatives to the proposed project in an effort to have an ideal development with minimal environmental disturbance.

This study identified the major environmental issues (environmental impacts) upon which analysis of possible options for the final development were based. The following alternatives were taken into consideration as a means of reducing environmental effects.

5.1 The NO – Action Alternative

The "no action" alternative is important to ensure the consideration of the original environment without any additional developments. It is important for the decision makers in considering all possibilities and taking an informed decision.

This option would mean that the local environment would remain in its present condition with dilapidated structures, scattered offices which results in service delivery delays, malfunctioning infrastructure as the wash rooms, absence of waiting lounges, absence of security fence around staff houses, continued shortage of offices with some operating under trees and untold suffering by the business community especially women.

Choosing this option would also lead to sacrificing the positive Social-economic impacts associated with this project including increased efficiency at the border post thus reduce delays and subsequently improve livelihoods in border areas. The projected cross-border trade, strengthened economic interdependence and support to regional peace and stability would be sacrificed among others.

This option will also not lead to social order disruptions through dust and noise pollution, disposal debris and other associated waste, soil erosion and storm water down slope. With respect to the Social-economic environment, the "no action" alternative would totally eliminate the positive impacts associated with the proposed construction of this project as highlighted in the report hence not a preferred alternative.

5.2 Alterative Project Location

The developer provided only one location for the proposed project thus no other sites were evaluated during the study. However, the site is preferred because of being close to the border, is not encumbered (belongs to Government), has easy access to required infrastructural services as piped water, access road, security and telecommunications services in addition to the architectural plans blending well with the existing land use.

In respect of the above reasons no alternative locations were taken into consideration during the study.

5.3 Phasing Execution of Project Components Alternative

Consideration should be made when executing the project to have them phased instead of implementing them at ago. By studying the site layout plan, phasing of project components construction can be considered where components that can be undertaken without relocating some of the existing infrastructure as offices should be promoted.

5.4 The proposed development as described in the assessment

The impacts and mitigation measures for this alternative have been thoroughly discussed throughout this report in addition to identifying the positive impacts associated with the development.

The project will not have significant impacts (social or environmental) considering that it lies amidst a built environment though issues associated with dust generation, construction traffic jam, noise and unsightly conditions in addition to increased storm water and wastewater and solid waste generation during the construction and operation phases will be registered. However, measures to mitigate these have been recommended.

Analysing the status of the existing Border Post infrastructure and the benefits that would be realised upon implementation of the proposed project, coupled by the suggested mitigation measures for ensuring that the proposed development does not lead to the degradation of the environment, this alternative is the most friendly and opportune.

6 PUBLIC CONSULTATIONS AND DISCLOSURE

Consultation with all relevant stakeholders including regulatory institutions is mandatory. The National Environment Act 2019, EIA regulations (1998) and the Conduct of Environmental Practitioners Regulations (2001), all demand for public consultation. A stakeholder can be defined as any individual, group, or institution with a vested interest in the natural resources of the project area and/or who potentially will be affected by project activities and have something to gain or lose if conditions change or stay the same.

This section of the report presents the objectives, process and the outcomes of the stakeholder engagement in the process of this ESMP. Consultation with key stakeholders is a continuous process that was be carried out throughout the ESMP period. It is the intention of developer to continue with it during preparation, operation and decommissioning phases of the project. During the study, stakeholder analysis exercise was undertaken to identify Interested and Affected Parties (I&APs) to the project.

6.1 Objectives of Stakeholder Engagement

The construction of the border post is intended to increase efficiency of transportation goods and people from Uganda to Congo and vice versa.

The primary purpose of the stakeholders' consultations was to provide an overview of the project to the relevant agencies, stakeholders in Kisoro District, Bunaganga Town Council and Cross Border Traders Association in the planning for the proposed project. This allows the PAPs to make an input at both planning and implementation stages of the project. The proposed project can have several benefits to the area, but it can also arouse environmental and social concerns. It is therefore important, that the contractor understands these concerns and seek to address them from the outset in an open and accessible way.

Consultation helps local people to understand how the proposed project activities will affect them, and how the contractor will operate to the highest possible environmental and social standards. Adoption of a formal "good neighbor" policy by the contractor is essential to win the support of communities for the proposed border post.

In the context of this project, stakeholder consultation aimed at achieving the following objectives:

- To facilitate an open and inclusive approach to consultation that provides timely and transparent dissemination of information concerning the project to all stakeholders regardless of their status, and to increase their opportunity to provide comment on the project and to voice their opinions.
- To provide the mechanism to give key messages to stakeholders and manage community expectations (e.g. about project timelines) and address concerns.
- ❖ To establish a feedback mechanism for ensuring that affected stakeholders have the opportunity to voice facilitate an open and inclusive approach to consultation that provides timely and transparent information concerning the project to all stakeholders regardless of their status, and to increase their opportunity to provide comment on the project and to voice their opinions.

- To provide the mechanism to give key messages to stakeholders and manage community expectations (e.g. about project timelines) and address concerns.
- ❖ To establish a feedback mechanism for ensuring that affected stakeholders can engage in the decision-making stages of ESIA. Part III Section 12 (1) of the Environmental Impact Assessment Regulation 1998 addresses public participation. It states that: "The developer shall take all measures necessary to seek the views of the people in the communities which may be affected by the project during the process of conducting the study under these regulations".

6.2 Key Stakeholders Engaged and Issues Discussed

Table 3: Stakeholder Engagement with Uganda Revenue Authority

Project: Proposed establishment of Bunagana Border Post				
Agency: Technical Persons: Government Officials /Uganda Revenue Authority				
Purpose of meeting:	To establish any concerns that Technical Persons [URA/Government] may have towards the establishment of the proposed one stop border post.			
Date, place, Time of Start and End of meeting	Meetings: June 5, 2019; 9.00am -10.00am; URA Boardroom, Bunagana June 19, 2019; 9.00am -9.30am; URA Boardroom, Bunagana July 3, 2019; 3.00pm – 4.00pm; URA Boardroom, Bunagana			
Meetings attended by:				
1) Byaruhanga Kenneth (M)				
2) Makego Ali (M)				

- 3) Mwesigye Benon (M)
- 4) Were Oscar (M)
- 5) Bwambali Bosco (M)
- 6) Kaacu Sam (M)
- 7) Agaba Steven (M)
- 8) Tuheise Louis (M)
- 9) Garuka Beth (F)

KK Architects and Partners:

- 1. Kabann Kabananukye
- 2. Martin Aryagaruka
- 3. Dr. Daisy Owomugasho

Aspects discussed are presented below:

- During construction works and delivery of materials; a lot of dust and noise are expected: flying sand/murram gravel particles are a nuisance.
- Solid wastes: identification of dumping grounds that are away from the Bunagana town.
- Project timetable should be respected: Avoid delays in project implementation: specific timelines in which the contractors need to carry out assignment
- long-term positive attributes associated with the development of the BP: prompt payment of taxes; contribution to area development projects;
- construction works would begin once all the necessary approvals are in place
- women and children from Uganda mainly obtain domestic water from (piped water that is free of charge) from the DR Congo

Project's positive attributes

- Improved security in the project area since the development facility will be having security fence around the URA premises,
- employment of a sizeable workforce during the construction phase; Promotion of cross-border trade, strengthen economic interdependence and support regional peace and stability;
- Providing market for the raw materials and inputs to be used during the construction and operation phases;
- Creating a modern facility offering space for offices, business and hospitality related activities currently yearned for by the stakeholders

Table 4: Stakeholder engagement with the Private Sector around the border area

Project: Proposed establishment of Bunagana Border Post			
Agency: PRIVATE SECTOR			
Purpose of meeting:	To establish any concerns that Project Affected Persons (PAPs); CBOs, NGOs; may have towards the establishment of the proposed one stop border post.		
Date, place and Time of Start and End of meetings:	June 19, 2019; 10.00am – 10.00am; KK Hotel Bunagana June 20, 2019; 9.00am – 11.00am; KK Hotel Bunagana July 3, 2019; 9.00am – 11.00am; KK Hotel Bunagana		
	54.) 5, 25.5, 51554		

ATTENDANCE

PRIVATE SECTOR, Bunagana CBTA

- Kwizera Innocent (M)
- Babanya Renatha (F)

- Tugume Ronald (M)
- Uwamahoro Desange (F)
- Nyiransaba Penina (F)
- Uwimana Esthar (F)
- Uzamukunda Charity (F)
- Tusabe Juliet (F)
- Cyomugisha Pamela (F)
- Musabe Dinavence (F)
- Niyimbabazi Isabela (F)
- Mutesi Jeninah (F)
- Kalitwe Charles (M)
- Busekuro Samson (M)
- Nkuruziiza Edward (M)
- Hakizimaana Gideon (M)

KK Architects and Partners:

- Kabann Kabananukye
- Martin Aryagaruka
- Dr. Daisy Owomugasho

Aspects discussed are presented below:

- The need for timely response to the reported GBV issues; risk assessments mechanisms were emphasized
- Cross-border trade: children, PWD, women and girls. Some of the PWD were concerned as to whether they would be provided with easy access ways.
- Employment, health and safety issues: The need for the provision of the right protective gear;
- Soil Erosion Impacts and Community Health and Safety: Water run-off (just across the border; Bunagana township in the D.R. Congo); and the flooding of farmlands within the outskirts of Bunagana township; and related impacts [contamination issues] on ground and surface water; The need to look into water supply and water consumption challenges (for homesteads; restaurants)
- Water sources: In Bunagana township, the easy access water sources are located on the D.R. Congo side across the border. The residents wondered as to whether they would be permitted to continue utilising the same water sources or if they would be provided with an alternative source of water

- Grievance Management: The need strengthens community-based institutions (Police, Social Workers, Courts, Local Council Officials, Religious Leaders, Contractors and employees' unions, Respectable elders to be used in grievance management
- forms were arising from business competition; refusal to pay for the services rendered;
- concerns towards effective management of dust, vehicular accidents,
- loss of working space especially those involved in cement loading and off-roading,
- provision of alternative working space when construction works are being undertaken.
- Grievance Management Processes (GMP): Emphasized were diverse aspects of GMP,
- The importance of Community based institutions (Police, Social Workers, Courts, Local Council Officials, Religious Leaders, Contractors and employees' unions, Respectable elders, through peer groups and SACCOS etc.) that handles grievances
- Availability of resources/ financing the grievance management processes: together with knowledge and awareness about grievance management processes were identified as important elements in the GMP
- gender discrimination, harassment and at times sexual abuse: husbands identified as perpetrators (sources of income and its expenditure; custody of children; refusal to spouse to participate in business; Polygamous marriages; Intimate Partner Violence; physical, sexual or emotional; Sexual Abuse of Children; wife battering including 'pushing, slapping, and holding them down'
- Workforce engaged in cross boarder businesses; and the envisaged influx of migrant labour workers [including women, girls and minors] during the construction phase
- Timely response to the reported GBV issues; risk assessments mechanisms
- **Safety and health of the workforce:** Migrant workforce: potential source of spreading contagious diseases especially HIV/AIDS, Ebola or any other emerging epidemic (such as COVID19)

Table 5: Stakeholder Engagement with Political Leaders

Project: Proposed establishment of Bunagana Border Post			
Agency: POLITICAL TEAM / COMMUNITY/ GRASSROOTS LEADERS			
Purpose of meeting:	To establish any concerns that Political Team / Community/ Grassroots Leaders may have towards the establishment of the proposed Bunagana Border Post.		
Date, place and Time of Start and End of meetings:	June 5, 2019; 11.00am – 2.00pm; LC1, Chairman's Office, Bunagana July 3, 2019; 2.00pm – 3.00pm; LC1, Chairman's Office, Bunagana		
Attendance			

- Abubah Mikwege (M): LC1 Chairman/ Mayor;
- Zainabu Munyeshaka (F):
- Byiringiro Sam (M): Town Clerk

KK Architects and Partners:

- Kabann Kabananukye
- Martin Aryagaruka
- Dr. Daisy Owomugasho

Aspects discussed are presented below:

- Cross-border trade: children, PWD, women and girls. Some of the PWD were concerned as to whether they would be provided with easy access ways.
- loss of working space especially those involved in cement loading and off-roading,
- the need for employment of the local people [construction workers (casual labourers)] where they possess the skills (create a strong and beneficial relationship),
- good working relationship with staff and workers
- acquisition of requirements like food items from the neighbourhood
- putting in place road safety signs and speed control interventions to avert accidents; emphasised the issue of road safety through observing the road reserve,
- capacity to supply the required attributes: as accommodation for workers, food stuffs among others
- women and children from Uganda mainly obtain domestic water from (piped water that is free of charge) from the DR Congo
- Soil Erosion Impacts and Community Health and Safety: Water run-off (just across the border; Bunagana township in the D.R. Congo); and the flooding of farmlands within the outskirts of Bunagana township; and related impacts [contamination issues] on ground and surface water; The need to look into water supply and water consumption challenges (for homesteads; restaurants)
- Water sources: In Bunagana township, the easy access water sources are located on the D.R. Congo side across the border. The residents wondered as to whether they would be permitted to continue utilising the same water sources or if they would be provided with an alternative source of water
- Grievance Management: The need strengthen community based institutions (Police, Social Workers, Courts, Local Council Officials, Religious Leaders; Respectable elders to be used in grievance management
- forms were arising from business competition; refusal to pay for the services rendered;
- concerns towards effective management of dust, vehicular accidents,

- loss of working space especially those involved in cement loading and off-roading,
- provision of alternative working space when construction works are being undertaken.
- Safety and health of the workforce: Migrant workforce: potential source of spreading contagious diseases especially HIV/AIDS, Ebola or any other emerging epidemic (such as COVID19)

6.3 Summary of Key Concerns from Stakeholders and how they are incorporated in the Project Design and ESMP

Table 6: Summary of Key Concerns from Stakeholders and how they are incorporated in the Project Design and ESMP

Key Concerns from Stakeholder	Incorporation in Project Design	Incorporation in ESMP				
Engagement with Uganda Revenue Authority						
Dust and noise nuisance expected	Provisional Sum has been allocated to preliminary cost to cater for environmental issues such as these	Section 7.3.2 shows management of impact of noise from project. Section 7.3.3 shows management of dust emissions from project.				
Project timetable should be respected	Single phase comprehensive construction drawings, specifications and Work programs have been prepared for the proposed works.	N/A				
Solid waste management	Provisional sum has been allowed to facilitate the building contractor in managing solid waste generated.	Section 7.3.6 describes management of solid waste during construction phase.				
Construction works should begin when all necessary approvals are in place	A building permit from Kisoro District has already been obtained. ESIA surveys have been carried out and a project brief submitted to NEMA for approvals.	N/A				
Security	The following installations/ facilities have been provided in the proposed design: chain link fence around the border post street lighting and CCTV surveillance gate/ security house waiting shed for small scale traders.	Section 7.3.12 elaborates on security during project implementation				
Employment of Locals	N/A	Section 7.2 gives employment as one of the benefits of the project.				
Engagement with Private Sector (Bunagana CBTA)						
Timely response to the reported GBV issues	Border management and Police facilities have been provided to timely handle	Section 7.5.2 elaborates the proposed Grievance Redress Mechanism to be used on site.				

	grievances during the operation of the border post.			
Access ways for PWDs in community	Ramps to the buildings and around the border post have been provided.	Section 2.1.10 elaborates the Occupational Health and Safety Act which requires that PWDs are		
	PWD toilets have also been provided	considered during establishment of such infrastructure.		
Occupational Health and Safety issues	Provisional sum has been allocated to the preliminaries for the contractor to implement all OSH measures.	Section 7.3.9 describes management of OHS aspects on the project.		
Soil Erosion Impacts and Community Health and Safety	Surface water/ storm water drainage channels have been provided.	Section 7.3.1 describes management of soil erosion.		
ŕ		Section 7.3.10 elaborates management of community health and safety aspects on the project.		
Water sources in the community	Water reservoir tanks have been provided (2 No. each 40m³)	Section 7.4.3 discusses about pressure on water sources and consumption.		
Grievance Management	Border management and Police facilities have been provided to handle grievances during the operation of the border post.	Section 7.5.2 elaborates the proposed Grievance Redress Mechanism to be used on site.		
Effective management of dust, vehicular accidents	 Traffic Control Barrier Structures have been provided Signages on the roads during and after construction have been catered for. 	Section 7.3.3 shows management of dust emissions from project. Section 7.3.11 shows management of traffic and accidents.		
Gender discrimination, harassment and at times sexual abuse	The following installations/ facilities have been provided in the proposed design: Small-Scale Traders (mostly women) Clearance Booth Police facility to handled cases of GBV and VAC Public toilet facilities for men, women, PWDs, to prevent GBV issues Women's crèche (for breast feeding mothers and diaper changing stations)	Section 7.5.1 discusses management of Gender Based Violence issues on the project.		
Influx of migrant labour workers	N/A	Section 7.5.1.2 elaborates about management of labour influx in the project community.		
Safety and health of the workforce	 Provisional sum has been allocated to the preliminaries for the contractor to implement all OSH measures. 	Section 7.3.9 describes management of OHS aspects on the project.

7 ENVIRONMENTAL AND SOCIAL IMPACT ANALYSIS AND MITIGATION MEASURES

This section describes the potential environment and social impacts of the proposed establishment of the border post. The methodology for analyzing the potential significance and magnitude of the activities is described and mitigation measures that developer should implement to ensure environmental sustainability during the project operation are as well laid down.

An impact is any change to the existing condition of the environment caused by human activity or an external influence. Impacts therefore maybe positive (Beneficial) or negative (adverse). They may also be direct or indirect, long term or short term, and extensive or local in effect. Impacts are termed cumulative when they add incrementally to existing impacts. Both positive and adverse environmental impacts could arise during the site preparation, construction and the operations phases of the facility. While the positive impacts will be enhanced, adequate measures are suggested for implementation to minimize, or avoid, or mitigate the identified negative impacts.

7.1 Methodology of Impact Analysis

The significances of the impacts were determined through a synthesis of the criteria as shown below:

Probability of Occurrence: This describes the likelihood of the impact actually occurring. It can be:

Improbable: The possibility of the impact occurring is very low, due to the circumstances, design or

experience (<25%)

Probable: There is a probability that the impact will occur to the extent that provision must be made

thereof (25-27).

Highly Probable: It is most likely that the impact will occur at some stage of the development regardless of

any prevention plans, and there can only be relied on mitigation actions or contingency

plans to contain the effect (>75%).

Duration: This defines the lifetime/persistence of the impact on the subject environment as;

Temporary: The impact will either disappear with mitigation or will be mitigated through natural

processes in a time span shorter than any of the phases (< 1 year).

Short term: The impact will last up to the end of the phases, where after it will be negated (1 - 3 years)

Long term: The impact will last for the entire operational phase of the project but will be mitigated

by direct human action or by natural processes thereafter (3 - 5) years).

Permanent: Impact that will be non-transitory. Mitigation either by man or natural processed will not

occur in such a way or in such a time span that the impact can be considered transient (>

5years).

Spatial Extent /Scale: Evaluates the area of occurrence/influence by the impact on the subject environment.

Site specific: The impacted area extends only as far as the proposed site up to a distance within 1km

radius of the site.

Local: The impact could affect the whole, 0r a measurable portion of the nearby environment

including the neighbouring residential areas up to a distance within 5km radius.

Regional: The impact could affect a large area as far as regional lever (above 5km).

The significances of the impacts were determined through a synthesis of the criteria as shown below:

Magnitude/ severity: The quantifiable effects of impacts on the environment. Does the impact destroy environment, or alter its function?

Low: The impact alters the affected environment in such a way that natural processes are not

affected.

Medium: The affected environment is altered, but functions and processes continue in a modified

way.

High: Function or process of the affected environment is disturbed to the extent where it

temporarily or permanently ceases.

Overall impact Significance:

Severe

This is an indication of the importance of the impact in terms of both physical extent and time scale, and therefore indicates the level of mitigation required. Using a combination of the above criteria, the overall. Importance of the impact is assigned a rating of severe, substantial, moderate, minor and negligible as described in the table below.

Impact Rating Description of Impact

- Highly noticeable, irreparable effect upon the environment
- Significant, widespread and permanent loss of resource
- Major contribution to a known global environmental problem with demonstrable effects
- causing mortality to individuals of a species classified as globally or regionally endangered
- Major exceedance of water/air quality and noise guidelines representing threat to the human health in long and short term, Causing widespread nuisance both on and off site.

- Highly noticeable effects on the environment, difficult to reverse
- Widespread degradation of resources restricting potential for further usage
- Significant contribution to a known global environmental problem when compared with the industry world-wide

Substantial

- Sub-lethal effects upon a globally or regionally endangered species compromising reproductive fitness and/or resulting in long-term disruption/disturbance to normal behaviour
- Air quality/noise approaching occupational exposure limits. Water quality parameters approaching maximum stipulated values
- Periodic widespread nuisance both on and off site

Moderate

- Noticeable effects on the environment, reversible over the long term
- Localized degradation of resources restricting potential for further usage

Table 7: Criteria for rating impact significance

- Sub-lethal effects upon a globally or regionally endangered species with no effect on reproductive fitness and/or resulting in disruption/disturbance to normal behaviour but returning to normal in the medium term
- Elevated contribution to global air pollution problem partly due to preventable releases
- Frequent breaches of water/air quality and noise guidelines;
- Causing localized nuisance both on and off site
- Noticeable effects on the environment, but returning naturally to original state in the medium term
- Slight local degradation of resources but not jeopardizing further usage
- Disruption/disturbance to normal behaviour of a globally or regionally endangered species returning to normal in the short term
- Small contribution to global air problem through unavoidable releases
- Elevation in ambient water/air pollutant levels greater than 50% of guidelines
- Infrequent localized nuisance

Minor

- No noticeable or limited local effect upon the environment, rapidly returning to original state by natural action
- Unlikely to affect resources to noticeable degree

Negligible

- No noticeable effects on globally or regionally endangered species
- No significant contribution to global air pollution problem
- Minor elevation in ambient water/air pollutant levels well below guidelines
- No reported nuisance effects

7.2 Anticipated positive impacts throughout project phases

The project is expected to employ a sizeable workforce during the re-construction phase and many more directly and indirectly when operational. Other benefits expected from the project include:

- Creating a modern facility that will increase efficiency at the border post thus reduce delays and subsequently improve livelihoods in border areas.
- The facility is projected to promote cross-border trade, strengthen economic interdependence and support regional peace and stability.
- Ensuring all offices are housed under one roof hence creating efficiency in cross border trade;
- Enabling comprehensive control of goods entering either country including controlled hazardous substances.
- Creating a modern facility offering space for offices, business and hospitality related activities currently yearned for by the stakeholders at the border;
- Provision of ample and safe car parking space hence contributing to traffic management at the border post once operational;
- Establishing a high value project unlike the current status today;
- Providing market for the raw materials and inputs to be used during the construction and operation phases;
- Contribution of revenue to Bunagana Town Council and national treasuries in form of taxes of various categories;
- Improvement of the aesthetic value of the area with a high value development facility in place
 with attributes currently lacking including convenient wash rooms, holding grounds for breast
 feeding mothers, provision of easy and convenient banking services, having all offices in the
 cross-border business sector under one roof; and
- Improved security in the project area since the development facility will be having security fence around the URA premises, security guards, sound barrier and better lighting system.

7.3 Negative Impacts Anticipated in the Construction Phase

7.3.1 Soil Erosion

The major issue during the construction phase will be soil erosion as a result of the earth works and the operation of borrow pits. Clearing of the site vegetation cover will encourage soil erosion by runoff and wind. Some erosion will occur after construction due to increased runoff from added paved surface and wind. Improper direction of the runoff from the site will lead to subsequent silting up of the drainage channels serving the town. Raised flanks are likely to occur as a result of the excavations to be undertaken.

Mitigation Measures

The speed of the runoff is one of the main contributing factors to erosion and siltation of the existing drainage channels. Storm water check dams or impact dissipaters in the side drains should be introduced. Storm water retention ponds should be established along the drainage channels to retain any run-off from the site. Later the area should be grassed. Regular maintenance of this infrastructure should also be undertaken.

Raised embankments along the excavated area should be vegetated after the construction works or stone pitched to stabilize them and deter soil erosion. Excavations should be undertaken in required areas only so that land that is not required for purposes of BP with the associated components construction is not disturbed. Earth works should be undertaken during the dry season to reduce on the possibility of soil being washed down the slope.

Topsoil excavated during site stabilization should be used to restore murram quarries or landscaping/backfilling lowly placed sections of the site.

Overall impact significance with mitigation: Minor

7.3.2 Impact of Noise and Vibrations

Noise is normally associated with construction works though it is temporal. Construction equipment and other activities like murram extraction will generate much of the noise associated with construction sites. Upon completion of the construction works, noise will mainly be coming from the increased vehicular volumes.

- All construction equipment will comply with the requirements National Standards on noise emissions in the environment by equipment for use outdoors.
- The equipment will be fitted with appropriate noise muffling devices that will reduce sound levels.
- As the project activities are performed, (in several noise level areas, according to the national legislation), every effort shall be carried out to comply with the corresponding noise limits for each area.
- Construction works shall not be permitted during the night; the operations on site shall be restricted to the period 7.00-19.00 h.
- All vehicles and machinery used at the construction sites shall be subjected to regular

maintenance. The vehicles and machines that are excessively noisy due to poor engine adjustment or damaged noise control devices shall not be operated until corrective measures have been taken.

- The construction traffic plan shall establish speed limits for construction vehicles and machinery at the construction site and the haulage roads used, and organize traffic so as to avoid as much as possible populated areas.
- Affected local residents will be kept informed on due time of the planned works and the
- vibration and noise levels and periods during which they will occur.
- The location of noisy equipment will be chosen as far as possible from sensitive receptors (houses, workplaces, schools and hospitals). When near sensitive receptors, constructions will be scheduled and provided with the necessary resources so that the time of exposure is as short as possible.
- Good management practice will be used to distribute heavy noise equipment along the route so as to avoid the cumulative effects of noise.
- In the case where noisy works would need to be performed at night or during a longer period than a day at a given site, a noise shield be erected around the working area.
- Monitoring of vibrations during the performance of critical work processes (e.g. foundation of BP) should be undertaken in building which are within a distance of 20-30 meters from the area where these works take place. Should buildings result damaged as a result of vibrations generated by the construction works, the damaged buildings will be repaired or compensation paid.
- Operate earthmoving equipment on the construction site far away from vibration-sensitive receptors as possible.
- Activities such as demolition, earthmoving and ground-impacting operations shall be scheduled so as not to occur in the same time period. Unlike noise, the total vibrations level produced could be significantly less when each vibration source operates separately.
- Decrease vibrations from construction sources, including:
 - o Blasting. Explosion type and weight, delay-timing variations, size and number of holes, distance between holes and rows, methods and directions of blast initiation
 - o Dynamic compaction. A smaller falling weight will produce smaller vibrations.
 - o Pile driving. Predrilling, pre-setting, replacement of displacement piles with non-displacement ones, switch impact hammer to vibratory one, replacement of driven piles with augured cast in-place piles or drilled shafts.
 - o Select demolition methods not involving vibration impact, where possible.
 - Avoid vibratory rollers and packers near sensitive receptors.
- A detailed BP noise and vibration study will be completed during the development of the detailed design of the BP project to determine the specific and optimum noise abatement measures to be taken.
- Proposed Noise mitigation measures leading to the decrease of noise exposure include measures implemented at the source of noise and measures that intercept the noise reduction between the source and the receptor: At the source:
 - Use power generators with canopy
 - o Noise barriers (protective walls) with noise reduction potential by 15-15 dB (A).
 - Insulation of house windows and façade with noise reduction potential by 10-30 dB (A).

7.3.3 Impacts on Air Quality

Construction activities have the potential to affect air quality mainly due to the dust created by activities during delivery of the required raw materials, excavation works, ground works and construction works. Dust emissions will be a result of earthworks, transportation of construction materials from quarries

especially during the dry season and through the fugitive dust from cleared areas and raw materials stored on site. The impacts will be greatly felt by communities in the immediate proximity of these roads. Fugitive dust has the potential of affecting the health of the workforce and area resident population.

In addition, construction plant and vehicles can affect air quality as a result of exhaust emissions. Suspension of dust through activities on the site or wind can cause a nuisance and affect human health. Favourable conditions for dust generation are dry weather combined with high winds. Continual or severe concerns are most likely near to dust sources, usually within 100 metres.

Particulate Matter Emissions – Minimal dust to be generated

Control Techniq	ues							
Fugitive Emission	Planting/ Vegetative	Paving Gravel	Wind Barriers	Sweeping &	Enclosure	Hood & Ducting	Reducing Drop	Water Spray
sources	Cover						Height	
Crusher					Х	х	х	х
discharge								
Screening					Х	х	х	х

Un paved roads	х	Х	Х					
Open Storage	×		Х				Х	х
piles								
Construction on		х	Х					
sites								
Exposed areas	Х	Х	х	Х				

Overall impact significance with mitigation: Minor

- Regular sprinkling of water along stretches under construction and routes used to deliver construction materials during the construction phase should be undertaken in a manner that effectively suppresses dust.
- Trucks delivering construction materials such as sand and murram and gravel should be covered with tarpaulins and once the construction activities are over, there will be limited dust pollution if the driveways and parking yard are paved.
- The construction site will be hoarded off to restrict dust to the site boundaries only.
- Construction workers will be provided with protective respiratory equipment like dust masks where need be.
- Vehicles and other equipment on site should be in good condition to limit localized emission releases to the environment;
- Careful driving should be the norm and observed by truck drivers hence they should limit their speed.
- Periodic automobile maintenance especially for those on site will be important in reducing the production of un-burnt carbon to the surrounding.
- Ducts to be used to direct debris from upper floors
- Accesses and construction sites will be kept moist to reduce dust formation.
- Water sprays will be implemented during drilling and excavation activities.
- In the dry season, hygroscopic additives will be used in water to increase its presence in the ground.
- Dust generating activities will be slowed down in days of strong winds.
- In windy and dry conditions, earth stockpiles will be moistened to prevent the lifting of dust particles.
- Ground will be moistened during loading and unloading of aggregates in trucks.
- Loaded trucks will be washed down prior to exit from working site to ensure that loose material is not tracked onto the roads.
- No unnecessary idling of construction vehicles at the construction sites will be allowed.
- Construction truck traffic will be optimized so as to get a minimum number of trucks
- Carrying the maximum volume of materials. This will be addressed in the construction Traffic Management Plan.
- The truck routes will be planned to avoid peak traffic hours or routes with heavy traffic.

- Regular maintenance of the diesel locomotives will be performed to keep them in optimal working conditions, including the achievement of minimal air emissions set by the manufacturer.
- Every effort will be made to use the cleanest fuels within technically feasible possibilities.

7.3.4 Poor Sanitary Waste Management

During the construction period, there will be influx of the population due to the employment of labour at the construction site. These people shall generate sanitary waste which can be a source of pollution if poorly managed and diseases if inadequately disposed of (Sanitary wastewater from the site temporal body waste handling facilities).

Mitigation Measures

Sanitary waste should be properly disposed of to avoid unsanitary and unhygienic environs around the project site. There will be mobile toilets for body waste disposal to avoid contaminating the neighbourhood and ground water with facial matter during the construction phase.

Once the project becomes operation facial matter will be handled by the planned centralised system comprising of septic tanks and soak pits. Wastewater pipes and sumps will be newly constructed. Pipe work will be subjected to periodic inspection.

Overall impact significance with mitigation: Minor

7.3.5 Impact of Fuel and Oil Spills contamination

Oil pollution will be from storage of fuel on site, washing of vehicle engines, undertaking vehicle servicing, fuel spillage as the contractor undertakes vehicle/equipment refuelling from the site. Waste fuel contains toxic substances such as polychlorinated biphenyls, polycyclic aromatic hydrocarbons and Chlorinated hydrocarbons. Such waste if not well handled can find its way onto soils and lead to its contamination which alters the properties of the soils. In addition, poor management of spillages can lead to seepage of these spills into the ground which can lead to ground water contamination and hence affecting communities that rely on this ground water.

- Extra care should be taken while refuelling trucks and equipment to avoid fuel spills. It is in the interest of the BP developer and the contractor not to spill any fuel as this implies loss of income.
- When servicing the equipment measures should be put in place to undertake effective disposal of the used oil or any oil wastes.
- Servicing of construction vehicles should be undertaken from designated areas like service garages. Well- serviced equipment reduces emissions of noxious fumes (carbon dioxide, carbon monoxide, nitrogen oxides, sulphur oxides).
- Potentially polluting materials, such as fuels, oils, chemicals and associated liquid waste materials, etc. will be stored in dedicated, segregated storage areas, with spillage protection and appropriate environmental security measures to prevent accidental release to ground during storage.

- In addition, appropriate working procedures will be adopted to minimise the risk of accidental
 release during delivery to and removal from the storage areas. Working procedures will ensure
 that these materials (raw and waste) are handled correctly. Working procedures will seek to
 prevent accidental release during the use of these materials, for example, vehicle refuelling and
 plant maintenance, especially with regard to waste oil.
- Procedures will be adopted to minimise the potential for accidental discharge of pollutants during the washing down of equipment and vehicles.
- All roads and hard standings will be kept clean and tidy to prevent the build-up of oil and dirt that may be washed into a watercourse or drain during heavy rainfall.
- Oil spill kits will be availed at the construction sites in case there is an accidental spill, so that it can be immediately cleaned up.
- Vehicles and construction machinery will be subject to regular preventive maintenance so as to reduce leakages of lubricants, motor oil and fuels.

Overall impact significance with mitigation: Minor

7.3.6 Improper Management of Solid Waste (Construction Debris/ Demolition Waste)

A variety of solid waste shall be generated from the construction activities of the border post. Poor Solid waste management destroys the aesthetics of the environment if poorly managed and as well takes up space which could be used for other productive purposes. The expect waste streams are during the construction stage will mainly be construction debris and demolition waste.

The exercise will generate significant amounts of construction debris (stone, sand, metal, pipes, and waste paper) and spoil while undertaking excavations during site stabilisation and laying foundations for the equipment and machinery. There will be solid waste generated by the workforce especially from the packaging of eats/ fruits/ cane, delivered/sold to them by vendors. These will lead to unsanitary conditions at the project site and immediate neighbourhood and will have an aesthetic impact in the project area if improperly handled.

- A site waste management plan should be prepared by the contractor prior to the commencement of construction works. This should include designation of appropriate waste storage areas, collection and disposal schedule to approved dumping sites.
- Special attention should be given to minimizing and reducing quantities of solid waste produced.
- Use the excavated material for backfilling.
- Provide waste bins for proper waste storage.
- Generated waste that can be re-usable will be sold or given away to interested parties.
- In all, waste management will be addressed through waste management system that addresses issues linked to waste minimization, generation, transport, disposal, and monitoring. The

developer/contractor will endeavour to implement systems towards these waste management systems.

Overall impact significance with mitigation: Minor

7.3.7 Degradation of Material Source Points

Reasonable construction materials including aggregates, hard-core, sand among others will be required for site stabilisation and construction works. This will be obtained from the privately-owned land. As the excavations are undertaken to obtain the required gravel, Steep flanks and deep pits will develop. Raw materials extraction is associated with dust and noise that are an inconvenience to the neighbourhood. Transportation of the material also poses danger to the children. If improperly managed water tends to stagnate at the bottom of the quarry thereby turning into a breeding ground for mosquitoes. Eroding of the bare flanks and deposition of gravel down-slope hence inconveniencing the neighbours is another issue associated with operation of quarries.

Acquisition of sand and rock materials is also associated with negative attributes like noise during blasting, dust and accidental rock fall especially during transportation.

During site levelling, some sections will be raised hence creating steep flanks that would induce soil erosion and the aspects associated with steep flanks.

Mitigation Measures

This is mainly concerned with gravel and sand quarries. The operators of murram gravel quarries should have a management plan for them and during their operation water stagnation should not be allowed to take place. After use of the quarry, proper landscaping should be undertaken to improve the aesthetic value of the area. The quarry should be fenced off to avoid accidental fall over from the quarry flanks. The contractor should procure from those having a management plan for their quarries.

In addition, the law requires that opening up of borrow pits and quarry sites should have independent detailed environmental and social impact assessment and approved by NEMA. This assessment shall guide on the proper management of material source points and thereby reduce potential impacts.

Emphasis will be put on ensuring that hard core and other stone aggregate materials are purchased from those obtaining them in a friendly way.

Overall impact significance with mitigation: Minor

7.3.8 Loss of secondary Vegetation cover

The proposed site is under food crops, exotic grass, fruit and ornamental trees hence site stabilisation for development of the BP will lead to loss of the existing vegetation cover. During the study survey, it was noted that all the vegetation cover and greenery is mainly secondary and not classified as endangered or rare species. To a large extent it has been mainly for provision of shade and aesthetic value.

Mitigation Measures

Minimal vegetation loss is expected considering that the site has for long been used for related activities (office and residential accommodation in addition to hosting a parking/loading and off-loading yard). Only vegetation within the areas to be developed shall be removed during clearing but no grown tree

species shall be eliminated. The minimal vegetation that will be cleared will be compensated with the greenery to be introduced after construction works.

In addition, proper landscaping shall be done with planting of ornamental trees and flowers done thereafter. This shall improve the aesthetics of the BP

Overall impact significance with mitigation: Minor

7.3.9 Occupational Health and Safety during Construction

Establishment of the BP will involve a big workforce during the construction phase. The possibility of accidental injury either minor or major is high as well as high chances of dust/noise related sickness during project development. Operators of the site machinery and equipment are also exposed to work related hazards which if not accorded the right protective gear. Impacts related to health and safety during construction are mainly related to accidents and injuries from falling objects, injuries from construction machinery, accidents from moving vehicles, slips, trips and falls. Some of these injuries become sources of chronic pain and damage while others can lead to loss of lives. This impact is negative, short term and reversible if corrective precautions are put in place. It can however be severe if carelessly handled involving deaths.

Mitigation Measures

- The works contractor will take measures to provide Personal Protective Equipment (PPE) to the construction workers like helmets, gumboots and overalls to help limit injuries during construction.
- Contractor/proprietor will provide well stocked first aid kit for the work force to cater for minor cases prior to any referrals to health centres or hospitals.
- The contractor will put in place proper guiding and appropriate educative signage at the site to keep the work force aware of their obligations and the general public aware that there is construction work in progress and appropriate precaution to be taken while at the site.
- Close supervision of work, including the provision of appropriate training for the workforce in observing better construction practices and handling emergency cases will be given priority and undertaken.
- The hoarding should be tall enough to avert any falling debris and other remains that may harm the public.
- The contractor should ensure that only trained workers operate equipment.
- Guidelines and regulations on site safety should be communicated to all workers, suppliers, sub-contractors and residents.
- All other measures as found appropriate to keep the workers and other people free from OSH hazards will be undertaken by the contractor in collaboration with the developer

7.3.10 Community Health and Safety during Construction

During establishment of the BP, a number of social concerns will come up and my affect the health and safety of the community around the proposed site for the BP. The main social concerns will be from site

neighbours regarding the issues arising from project undertaking such as dust, noise, sharp lights at night, and vehicular traffic along the road. Other cases may involve behaviour of workers on site as most of the workers on construction sites tend to be abusive, destructive to property and lack respect for the public. Migrant workforce is likely to lead to spread of contagious diseases especially HIV/AIDS, Ebola or any other emerging epidemic thus, putting pressure on the existing health facilities and increasing the disease incidence in the area. Disagreements about the working hours between contractors and neighbours also can create social conflict. This impact should be made negligible by engaging the parties involved by the developer and contractor prior and during implementation but can also be severe if ignored as it can hamper project progress.

- The developer will engage the resident neighbours and area local leaders prior to commencement of the project. This helps in ironing out their grievances, ensures project ownership by the community and fosters cooperation.
- The developer and contractor will employ mainly area residents during the construction to minimize any form of social order disruption through influx of migrant labour force.
- Working hours during the construction phase will be restricted to daytime since the project
 has a component of residences to avoid any interruptions to the neighbours especially
 during night.
- Any form of misunderstanding will be amicably solved with the help of local leadership.
- Safety signage shall be installed at the site and along the road to guide communities on safety aspects during the project construction.
- Construction work shall commence on site only when the construction phase Health & Safety (H&S) Plan has been adequately developed by the Contractor and approved by MOWT Representative
- Traffic Management Plan will be developed for the safe use of vehicles on and off site; driving standards; safe access to construction sites with minimum negative impact on the existing roads and in parallel for ensuring community safety and easy access to their properties (homes, land and gardens). Workforce transportation should be considered within TMP.
- A construction community Health and Safety Educational Programme will be developed to
 inform and build awareness and understanding of the local community and drivers on the
 construction hazards and potential adverse impacts during the construction phase and how
 to minimise the potential for an accident and/or injury to occur. The Programme will be
 linked to the SEP and utilize various communication methods to address the needs of
 vulnerable groups such as children and illiterate residents.
- Workers must receive training and guidance on how to avoid conflicts with the local community members and sign code of conduct, in order not to create conflicts with local government.
- Any damage or grievance shall be managed by the Grievance Process and any repair/compensation be made in a timely basis.

- Worker transportation and modes for workforce movements during construction works will be organized in a way that will minimise negative impacts on local residents.
- The design and location of structures along DRC Highway must take into account the views and concerns raised by local residents and other stakeholders, especially UNRA. Evidence of consultation with stakeholders to be retained.

7.3.11 Traffic interference and accidents

Site preparation and construction activities will see an increase in the movement of heavy vehicles and construction equipment. This will cause disruption of traffic along the access road with possibility of accidents. Since the normal traffic along the road is a bit high, any interference for a few minutes will lead to build up of traffic causing delays and anxiety and possibly unnecessary accidents. The impact is limited to construction phase only and its magnitude may be low to high depending on when and how it impacts on the recipients.

Mitigation measures

- Proper signage will be installed at appropriate distance at diversion point to warn all road users of on-going construction activities and thus heavy vehicles. Such signs may be like "Heavy trucks turning ahead".
- Most of the construction materials will be delivered to site during off peak hours when there
 is always minimal vehicular volume on the road or early in the morning before heavy traffic
 builds up to minimize traffic hindrance and delay.
- Proper temporary road barriers such as humps will be put in place to limit speed and drivers will be cautioned to check speed.
- The developer will liaise with traffic officers to ensure adequate signage on the roads during the construction phase for smooth flow of traffic and to warn and alert other road users of the construction activities on site.
- Flagmen should also be employed to control traffic and guide vehicles during offloading and heavy vehicle turning.
- The developer should also prepare a traffic management plan (TMP) which is a site-specific plan that covers the design, implementation, maintenance and removal of temporary traffic management (TTM) measures while work or activity is carried out.

7.3.12 Security

During the construction stage, there will be a number of people frequenting the site especially employees at the site and service providers. There will also be a variety of construction material that will be stored at the site both while construction is ongoing. Therefore, there is a likeliness off some of the material being stolen by some ill-mannered workers at the site and other individuals that may access the site illegally. Some of these may be armed and as they tend to steal items, end up hurting other personnel at the work site. Therefore, the contractor shall put in place measures to ensure the security of personnel, equipment and material that are at the work site. These shall include the following;

Mitigation Measures

- The construction site should be fully horded off using material such as iron sheets to prevent random access to the site by unauthorized people.
- The site should be given one access with a lockable gate and full-time armed security guards to monitor entry and exit of all personnel equipment and materials to and from the site.
- Security cameras should be placed in strategic locations around the camp site to record all
 activities that happen at the construction site both day and night so as to ensure easy follow
 up on security cases.
- Metal detectors should be installed at the entrance to the construction site to ensure that armed weapons and devices are not allowed through the gate.
- Security lights should be installed around the construction site to provide illumination to the equipment and materials at the site during the night hours.
- Working hours should be restricted to the day time so that only security guards are expected to be at the site during the night time. This will reduce on the potential of work activity in the night and thereby reducing the risk of theft at the site.

7.3.13 Disruption to Work

During construction, there will be temporal disruption to smooth operations of the customs department of URA among other offices within the existing structure to be redeveloped, hence inconveniencing the inhabitants of these offices and the business community that use the border post on a regular basis. In addition, the lone pit latrine serving the bigger community will be done away with during the construction phase hence inconveniencing the user community. The URA resident staff will lose their areas of aboard during the re-construction phase.

Mitigation Measures

The URA as the sole owner of the land housing the proposed site for the border posts, has got a number of other structures at the site, apart from the one to be refurbished, in which they currently reside. During the refurbishment of the structure, URA shall move into other structures within their premises temporarily until the redevelopment of the existing structure is done. After completion of the redevelopment. The URA and other agencies under their property shall move into the completed structure and the other smaller structures shall as well be demolished as per the project plan.

7.4 Negative Impacts Anticipated in the Operation Phase

7.4.1 Impact of poor solid waste management

Solid waste will be generated from the border post offices. The waste stream from the facility will mainly include food remains, package bags, stationery waste and other forms of domestic and hazardous wastes depending on the different goods. If not well managed, the area could be prone to nuisance from foul smell, breeding of vermin and vectors, and lead to outbreak of diseases.

Mitigation Measures

• Waste collection bins will be provided at strategic positions at the structure for temporary waste storage. The waste collection bins shall be provided with covers to avoid spillage by scavengers;

- Coded litterbins shall be provided at the building with a provision for sorting the wastes according to their composition (biodegradable and non-biodegradable wastes); and
- Arrangements will be made to hire a certified waste collection company to transport the waste for final disposal to designated waste dumping sites approved by NEMA.

7.4.2 Pollution from wastewater from human occupancy

The border post will have water borne sanitary facilities. Therefore, a significant amount of sewage and effluent will be generated. Any mismanagement will lead to pollution of the area as well as cause risk to public health of the structure occupants and neighbouring residences.

Mitigation Measures

- Well-designed plumbing system will be installed to collect all the wastewater from washrooms and toilets to the septic tanks for effective treatment and final disposal;
- Ensure prompt emptying of the septic tanks once it's full to avoid overflow into the nearby environment causing pollution.
- Routine quarterly maintenance should be done to ensure there are no leakages in the sewer system to ensure no seepage of waste water into the ground.
- Periodic maintenance regime for the plumbing system will be put in place and implemented to minimize the health risks associated with broken / malfunctioning system

7.4.3 Pressure on water consumption

Considerable quantities of water are required to maintain hygiene, sanitation, cooling and heating purposes in addition to being one of the major raw materials. Bunagana has been having water shortages in the past which have affected the community around the border post. The operation of the border post using water-based facilities shall increase the water demand required in operation of the B and the Bunagana community at large.

Mitigation Measures

A number of strategies outlined below will be utilized in reducing water consumption and water use costs.

- Installation of fixtures that restrict or control the flow of water for manual cleaning processes, as well as meters to monitor water use;
- Use of high pressure rather than high volume horse pipes for cleaning surfaces;
- Reporting and fixing water leaks promptly;
- Good housekeeping as well as operator/employee and management awareness on water use costs and reduction efforts.

There should be operational measures put in place, in addition to the design and infrastructural measures, to ensure that the water resource is not wastefully used. Below is a summarised checklist for water conservation.

Table 8: Water Conservation Strategies

Areas	Strategies
Housekeeping	Do not leave the tap running while cleaning, use buckets for holding water instead;
	 Make sure that all water handling/distribution gadgets do not leak & are in good condition;
	 Report immediately any leaking or dripping water handling/ distribution gadgets or toilet;
	Purchase and use of water saving equipment (Install infrared-activated faucets and
	toilets in public washrooms);
	- Use of automatically timed water equipment like on hand wash basins and kitchen sinks;
	 Keep utility bills to track the consumption of water;
	Establish an effective employee-training program about water conservation; and
	Use harvested rain water for floor cleaning and watering of ornamental plants.
Restaurants	 Do not leave taps and other water release point running;
	 Wash food products like potatoes in buckets, bowls or containers;
	 Use dishwasher with sufficient loads;
	Do not use water to defrost or thaw frozen food products. Defrost in refrigerator;
	Report any leakages immediately;
	 Make inspections of dishwasher pumps for water leakages;
	Track the consumption of water by regular monitoring utility bills;
	 Establish an employee-training program about water conservation; and Install infrared-activated faucets and toilets in restaurants.
Maintenance	Regular inspections of circulating pumps for water leakages;
	Report immediately any water equipment leakage;
	Purchase and use of water-saving equipment; and
	Track the consumption of water by regular monitoring utility bills.

Once the Nkaka water supply project is completed and extended to Bunagana, the current water shortage experienced will be no more. Current practices of water harvesting should be upheld on the additional structure to be established.

Overall impact significance with mitigation: Minor

7.4.4 Pressure on energy consumption and control

Given the extent of operations and number of energised drives, energy consumption will be quite high. The energy needs of the BP will include machinery used in the offices such as computers, printers, sealers, air conditioning, among other needs. This increased energy demand may increase pressure on the community which can lead to shortages and possibly increase load shedding in the area.

Mitigation Measures

There is need for instituting energy saving techniques to bring down energy costs and shortage.

First; backups should be installed, automatic generator introduced (UNRA should hand over the power infrastructure on site to URA) and diverse energy sources should be applied like use of solar for lighting among others. Conservation practices of switching off unwanted lights should be encouraged, centralizing energy connections for a central switch should be done where needed, automatic energy controllers and appliances used. Windows and structural designs to be used should be those that enable use of daylight in the building. Meanwhile records should be kept for energy auditing to check progress regarding conserving and reducing wastages.

Other power saving considerations includes:

- Make someone the Energy Champion of the establishment so they can allocate staff certain responsibilities, e.g. making sure lights are switched off they're not needed;
- Involve staff. Let them help you to work out an action plan for making the BP more energy efficient and therefore more competitive;
- Use low energy light bulbs (Light Emitting Diodes LED). Replace standard fluorescent tubes with slim line tubes;
- Install movement detectors to control lighting in areas not in constant or frequent use, such as toilets;
- Don't leave electrical equipment switched on or on standby mode for long periods when not in use;
- Make sure there is adequate ventilation at the top and back of refrigeration equipment, and that the coils are cleaned regularly to remove dust and fluff. Energy consumption will increase if the heat cannot be dispersed;
- When buying or leasing equipment, always ask about energy efficient models;
- Have electrical fitting devices such as time-switches, thermostats, and photo-electric cells. This
 saves electricity by making sure it is only used when it is needed, or by controlling temperatures
 accurately;
- Make sure motors are kept clean and have an air-flow free of rubbish or stored material; and
- Monitor your progress and keep your energy.

Overall impact significance with mitigation: Minor

7.4.5 Likelihood of fire outbreaks

There is a potential risk of accidental fire outbreak in the structure especially as a result of short circuits. Careless use of power appliances or possible torching of the building by arsons is all major fire sources. In addition, the type of materials to be stored in the BP may be flammable and hence cause a fire outbreak. This can lead to significant loss of property and at worst lives.

Mitigation Measures

• The proprietor will put in place a comprehensive fire plan to guide the occupants and users of the BP in case of fire outbreak;

- All electrical wiring will be carried out by certified electricians in liaison with the developer;
- There shall be installation and proper maintenance of firefighting equipment;
- The building will be fitted with smoke detectors and fire alarms that should periodically be checked to ensure effective performance.
- Management shall carry out annual fire drills to ensure evacuation plans are effective and are understood by all occupants; and
- The premises shall also have permanently stationed security guards and lighting to ensure security against arson-associated fires.
- Ensure the use of circuit breakers.
- Training of the workforce in firefighting and emergency response shall be done by the developer to ensure quick response.
- Designation of assembly points in case of fire hazards shall be done
- Regular oiling of machinery contacts to avoid fire sparks; and
- Regulation and avoiding any fire contact with inflammable substances.

Overall impact significance with mitigation: Minor

7.4.6 Possibility of Natural Disasters

The site to be developed is subject to being struck by lightning or to be affected by earthquakes or earth tremors. However, the proposed building is located in less severe earthquake prone area. In addition, the proposed area has not had severe natural disasters, but nevertheless, the developer should be prepared in case any is to occur.

Mitigation Measures

The new building will be equipped with modern lightning conductors/arrestors to handle any would be lightning strikes as is the case with the existing structures. Site geotechnical investigations have been undertaken and the results have proved that the site is suitable for development and free from natural faults that would cause weakening of the grounds subsequently causing giving away of the structures. Details in appendix 6.

Overall impact significance with mitigation: Minor

7.4.7 Likelihood of collapse of structure

There is a possibility where a section or all the structure established can collapse during the operation phase. This can result from use of substandard materials or natural disasters. When such takes place, it is likely to lead to extensive damage both to property and human life for both the inhabitants of the structure and the neighbouring communities.

Mitigation Measures

Use of standard and UNBS certified quality materials should be ensured. The services of credible building contractors will be put to use in addition to periodic testing of the concrete mixture through

certified consultants and calling in inspections from qualified entities. If found lacking the contractor will be made to comply with the required standards or have the contract cancelled and a credible contractor taken on. Supervision of works will be undertaken by a certified firm, and the site Engineers should have membership of renowned certification agencies.

Overall impact significance with mitigation: Minor

7.5 Mitigation of other Social Impacts

7.5.1 Gender Based Violence Mechanisms

7.5.1.1 Gender Based Violence and Violence against Children

The Bunagana border area is usually swarmed with movements of traders on market days on either side of the border. Both men and women cross the border to engage in trade for goods and agricultural produce. Cross border trade is a male domain, however, increasingly women are beginning to engage in the sale of food items, fabric, and management of kiosks and in the other aspects of the border trade. At times, even children engaged in trade and in the management of wooden scooters (a common means of transport in the area) loaded with merchandise or produce. In such an environment, men tend to have an upper hand with available opportunities, processes/ procedures required for trade to occur and general decision making. The few women involved experience gender discrimination, harassment and at times sexual abuse as they compete with their male counterparts for a share in the trade.

Violence against women, children and sometimes against men; including vulnerable groups, such as older persons, people with disabilities (PWDs), contributes to enduring physical and mental harm, while undercutting the ability of survivors, and often their families, to engage in meaningful and productive lives.

The implementation of Project activities may aggravate gender-based violence and/or sexual harassment affecting mainly women if not carefully studies and mitigated. There is a likelihood that women may be discriminated against during allocation of spaces in the temporary site.

During construction, the contractors and workers on site may discriminate women by refusing to give them work, contract them to provide services on site, give them low pay for same work done as their male counter parts or, use them sexually in exchange for providing them work at site.

In addition, there is worry that women vendors who will supply services including food, water and casual labour to the contractor or staff on the site may experience sexual harassment and discrimination by the contractor, or contractors' staff by failing to pay for the services provided. Being a border post, there is also likelihood for workers and contractors' staff to engage in human trafficking directly or, through sexual engagements with young girls who may later elope with them.

Finding solutions to reduce and respond to GBV and VAC is of paramount importance to the Project in a bid to ensure safety and well-being of individuals and communities. It is on this basis that, the project sought to identify and understand the processes to prevent and mitigate against risk of GBV and VAC, including sexual exploitation and abuse (SEA), and other forms of GBV directed at women and children and other vulnerable populations.

Since scope of the construction is not so extensive, labour is intended to be drawn from community unless the required skills are lacking. The work will therefore not attract large influx of migrant workers.

The Project will also be undertaken in one place and implemented in a relatively short time span hence, limiting the impact GBV and VAC.

Border committees have been established. These should be made more effective through training to handle complaints from the traders and community members in the project area of influence. In addition, the Project should create awareness to the communities on their rights, responsibilities and put a redress mechanism in place. This is particularly important considering that the most of the communities and vendors are semi illiterate and therefore ignorant of their rights and obligations. Limited knowledge of the channels for reporting and seeking justice by traders and community members whose rights are violated further aggravates the problem of GBV and VAC. Efforts should be made to communicate to them in the local languages using printed materials and radio programs.

The project should put in place mechanism to ensure that any cases of GBV are reported and addressed quickly. Provisions on the code of conduct should be included in the contract with the contractor to ensure no incidences of GBV by the staff on or off the site. The contractor must ensure workers sign contracts with a clause on the Code of Conduct.

The community development office of the Kisoro District Local Government continues to play an important role if addressing family related cases. In addition to the grievance committee, the Bunagana Police Posts and the District Police station will be involved as and when the nature of the offence warrants. The Project will work with established Government/District Local Government structures to provide alternative redress mechanism for cases on GBV and VAC that may arise during project implementation.

Mitigation Measures

To mitigate against GBV the Project should;

- Include in contractor's contract a provision on observing the code of conduct to prevent GBV. The contracts of the staff of the contractor should include a clause on the GBV as elaborated under Codes of conduct attached in Annex 5.
- Train and create awareness to Contractors staff and workers on what GBV and VAC is, responsibilities, penalties and redress mechanisms.
- Create awareness to the vendors and the communities using printed materials and radio programs in local languages to enable them understand gender-based violence; their rights, responsibilities and redress mechanism.
- Work with the communities, the Local Council, and vendor's/ trader's association to ensure that any GBV case is quickly identified and addressed.
- Work with the District and the Police to ensure any cases that are registered are addressed as quickly as possible and in a manner that provides justice to the victim.
- Increase representation of special interest groups on grievance redress committees, Joint Border Committees and Cross Border Trade Associations.
- Establish a feedback mechanism to monitor activities of the contractor's staff on and outside the site to ensure compliance with the code of conduct.

7.5.1.2 Project-related risk factors: Labour Influx

The scale of labour influx is considered insignificant. This is based on the assessment of the extent to which the targeted Bunagana project communities' capacity is to absorb labour influx; this will not require separate camp facilities. This is because the minimal differences between community Socioeconomics and inflow of income to workers which could have exacerbated inequities between workers and community members, and the geographic location of project activities. It is proposed that, Labour should be drawn from the community unless the required skills are lacking.

Mitigation Measures

The following additional measures will be undertaken in identification and mitigation of SEA and GBV risks:

- Strengthen risk assessments and use them to trigger action: The project will be mindful on how the SEA/GBV risks can be monitored, on a continuous basis through the life of a project; SEA/GBV specific risk assessment /analysis methodologies
- Educate and raise the awareness of women, adolescents and children of SEA and their legal rights and potential risks. This will among others, include the matters related to the influx of labour associated with a project and made aware of the laws and services that can protect them and provide redress in case of an incident.
 - a) Children/ minors: identify and support appropriate local community institutions/expertise to consult with children;
 - b) one of the mitigation measures is for CSOs with expertise in child abuse and the sexual exploitation of children as well as those with expertise in project-related risks e.g.: Health services, psychosocial support, security and access to legal services.

7.5.2 Proposed Grievance Handling Processes: Operationalising GRM

This involves the main stages of settling of a grievance as quickly as possible, from its point of origin and encourages staff and their superiors/managers to resolve grievances informally. The following three (3) stages are set to address the situations where this is not possible. A Grievance Form (Appendix 7) has been designed for easy application of the procedure. Two grievance redress mechanism shall be put in place, one for the general public to report issues on the project and another grievance redress mechanism for workers to report labour and working condition related cases. Both GRM should make provision for escalation of unresolved issues and depending on the nature of the grievance. GBV/VAC should be referred to relevant agencies lie police, health facilities or CSOs in the area that handle GBV/VAC related issues.

Stage I: Statement of Grievance

- An officer/ or the aggrieved person who has any grievance or complaint should raise it with his/her Head of Department (this can also be the LC1, and another community leader that are respected by the community: such as churches and Mosques), SACCOS, and the 'Batakka tweziike' community groups) in writing by completing the Grievance Form.
- The Head of the Department (this can also be the LC1, and another community leader that are respected by the community) will give an answer as soon as possible and within a maximum of seven (7) working days.

The Community: A Risk Management Partner

Bunagana local community norms and context:

- in which social relationships occur —such as families, schools, neighbourhoods and workplaces—influence incidence of, and tolerance for, violence
- At the same time, community members are often the most knowledgeable about locally relevant risk and protective factors.

With respect to their contribution to and mitigate against the risk of sexual exploitation and abuse

To foster continuous partnership with community actors to prevent and respond to SEA and to build community resilience will be made through:

- Stakeholder analysis/ identification of community partners: This will involve the identification of local
 community partners and or trusted sources for receiving and disseminating information; as well as sources
 of support to provide timely services to victims and survivors of violence.
- Engaging with the Bunagana project communities to build trust and transparency will be made through community engagement activities throughout the life of a project. This will also involve the sharing of information about the targeted project with communities. This will be made through:
- early and transparent disclosure of anticipated project activities, intended outputs and expectations for contractor and worker behaviour, including reviewing the contractor's worker Code of Conduct.
- checklists on effective supervision on environmental and social issues: should include requirements for continuous community engagement.
- Benchmarks for continuous community engagement should also be built into the project plans and milestones for project implementation
- Use of innovative communication channels for engagement and feedback. Among others, this will involve
 identifying telephone contacts for all stakeholders. The aim in this is to extend the reach of traditional
 mechanisms for dissemination of information from project activities through new technologies such as
 social media and text messaging platforms.
- Grievance Redress Mechanisms for SEA/GBV: This will among others involve periodic review and learning (response to SEA/GBV) of the existing national policies and frameworks.

State II: First Appeal Level

- If the matter is unresolved at stage II, the aggrieved officer can appeal in writing to the Town Council chaired by community development officer and other key relevant member (such as Resident District Commissioners (RDCs or other security agencies)
- The above officers will at his discretion arrange a personal interview with the aggrieved officer and will give a written reply to the latter within fourteen (14) working days.

Stage III: Second and Final Appeal Level

• It is expected that most of the cases will be solved at Stage II. But in exceptional circumstances, where this is not possible and matter remains unresolved, the aggrieved officer may present it in writing to the Ministry of Trade. Works and other key relevant agencies who will handle the matter and give a written reply within a further fourteen (14) working days.

7.5.2.1 GRM: Monitoring and Evaluation

Bi-annually, the GRM will make available to the public, a report describing the work of the GRM, listing the number and nature of the Grievances received and processed in the past six months, a date and description of the Grievances received, resolutions, referrals and ongoing efforts at resolution, and status of implementation of ongoing resolutions. The level of detail provided with regard to any individual Grievance will depend on the sensitivity of the issues and Stakeholder concerns about confidentiality, while providing appropriate transparency about the activities of the GRM. The report will also highlight key trends in emerging conflicts, Grievances, and dispute resolution, and make recommendations regarding:

- i) measures that can be taken by the Government to avoid future harms and Grievances; and
- ii) improvements to the GRM that would enhance its effectiveness, accessibility, predictability, transparency, legitimacy, credibility, and capacity

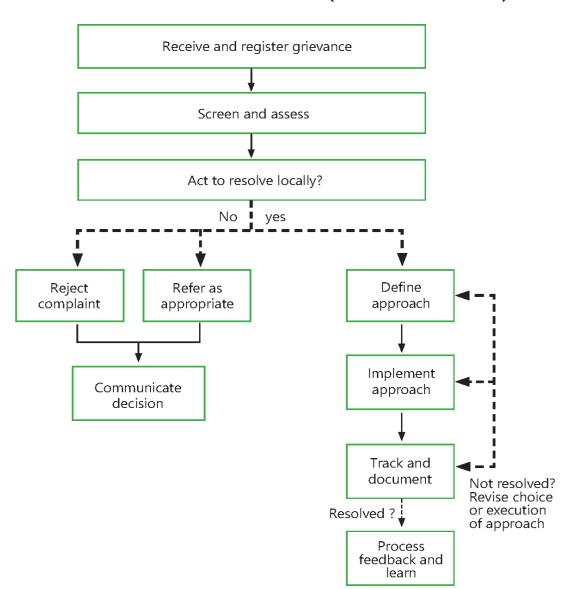

7.5.2.1.1 Role of the Human Resource Office in the Procedure

The Human Resource Office is responsible for advising the concerned parties on the handling of staff matters including grievances and may be directly involved at all stages. It is also responsible for monitoring the effectiveness of the grievance procedure and ensuring sufficient supply of Grievance Forms for use by staff when need arises. In addition, the office will receive the grievance forms at the conclusion of the grievance procedures, for records and for future reference if need arises.

7.5.2.1.2 Resources and Budget lines for GRM

A GRM should have a realistic budget that will sufficiently cover the costs of its operations such as staffing, awareness campaigns, capacity-building training, infrastructure and support services, field inspections, meetings, documentation, and supplies. In is proposed that the GRM budgets are built into the monitoring and evaluation or outreach and communications budgets of the project implementing agencies.

7.5.2.1.3 The Proposed Grievance Handling (Process Flow Diagram)

THE PROPOSED GRIEVANCE HANDLING (PROCESS FLOW-DIAGRAM)

7.5.2.1.4 Grievance Appeal Committee

The Grievance Appeal Committee (GAC) will comprise the Project Co-ordinator (or representative thereof), and other project management staff.

The GAC will serve as the second level authority for redressing grievances, which are not resolved satisfactorily for the claimant. The GAC may assign a second investigation of the grievance case to another expert or group of experts, depending on the required expertise for analysis and reporting. Alternatively, in grievance cases, which have legal implications, the GAC may decide to pursue a course of action that will best meet the interest of the claimant and the project.

7.5.2.1.5 Legal Handling of Grievance

Grievance cases, which may bear serious implications to the project and the institutions involved in its governance will be consulted with a lawyer and based on recommendations, the GAC may follow legal process to manage the grievance case, if satisfactory solution for all parties involved cannot be achieved through a communication, discussion or mediation process.

7.5.3 Effects of Employment

Several people will be employed both during the construction and the operational phase. This represents an increase in the level of employment within the study area and therefore has a high potential to be a significant positive impact that does not require mitigation. However, emphasis should be put on employing people from the area of influence of the project site so as to deter negative attributes associated with area foreign workforce.

Those employed will have to observe the standing rules and regulations governing the Ugandan labour market and must possess the skills or will to be trained. Improved incomes with the associated positive attributes are expected once the project takes off.

7.5.4 Public Health and Occupational Safety

The impact of work place hazards, diseases, air, noise and dust pollution can easily be reduced/mitigated by instituting the following measures.

- Adequate protective gear be accorded to workforce in addition to protection of the conveyors and other machinery to avoid accidents caused by un-protected equipment;
- Promotion of use of local labour force where necessary in addition to having sensitization programs on impacts of diseases to the workforce and community;
- Having a code of conduct for the workforce and community educative and awareness programs;
- Regular sprinkling of water along stretches under construction and routes used to deliver raw materials should be undertaken;
- Careful driving should be the norm and observed by truck drivers hence they should limit their speed.
- Truck delivering wind-blown raw material as and sand for construction should be covered with tarpaulins;
- Proper maintenance of equipment and machinery in addition to sensitisation of the workforce will ensure reduced noise emission;
- Sensitisation of motor vehicle owners not to hoot anyhow and to leave vehicles on idling will reduce on emission of fumes hence minimal pollution of the air.

Hygiene and sanitation issues have to be taken into consideration. Mobile toilets should be provided and vendors of edibles should be responsible for the by-products of their edibles (solid wastes from their products).

Protective gear should be accorded to the workforce in addition to having first aid kits on site for any emergence case. Training and knowledge of first aid administration should be given priority. The workforce should have access to clean water for drinking.

Waste water/sewerage from the BP and associated attributes will be handled by the planned centralised sewerage system to be established at the BP.

Overall impact significance with mitigation: Minor

7.5.5 Social Order Disruption (Disturbance to Public)

Advance warning on the impending construction activities should be given to the communities in the immediate proximity of the site and the material delivery routes.

URA Staff residing on site will also be temporarily disrupted in addition to customs services to the business community. Informative signs should be put in place to guide road users or communities in the proximity.

In areas with heavy vehicular traffic during the normal working days, work should be undertaken during off-peak hours. Use of flag men to guide traffic should be promoted.

URA staff shall be accorded ample time to move into the already existing empty shelters on the property. This shall be done is a phased manner to ensure minimal disruptions in the normal service delivery at the border post. Arrangements are being made to ensure smooth relocation of current business undertakings on site before start of construction works. There will be no need of a RAP.

Overall impact significance with mitigation: Minor

7.5.6 Noise and Dust

The proposed development will inevitably emit some noise and dust to the immediate neighbourhood. This will be a result of site landscaping and stabilisation. Flying sand/earth/ gravel particles from construction works and delivery of the required materials will lead to dust and noise pollution. Proper and effective safe keeping of the construction materials should be undertaken. Dust preventive material should be wrapped around the building to cover dust source points and deter its emission to the immediate neighbourhood.

Sprinkling of water or wetting of dust source points during sunny days will be undertaken to do away with dust pollution. Proper hoarding of the site will be undertaken to retain the likely soil to be deposited down the slope/road and proper landscaping will be undertaken once the construction activities are over.

Regular sprinkling of water along material access routes should be carried out during the dry season to avert dust pollution caused by trucks movement along the dusty roads.

Protective gear should be accorded to personnel working in dusty environments. Trucks delivering construction and required raw materials should be covered while in transit. Raw materials should be well covered and kept in banded areas to avert being blown by wind.

Paving of the open areas should be a must to do away with dust generation from un-paved surfaces during the operation phase.

Other social concerns include unpleasant smell from poorly managed wastes (odour smell). Poor housekeeping practices, such as improper and untimely disposal of food remains, foul water, oils and other wastes from the BP, poor maintenance of sewerage and effluent drainage facilities are likely to lead to emission of odorous smell.

Waste bins will be made available for garbage segregation and efficient pick-up and disposal arranged with contracted agencies since the town council is not yet operational. Immediate repairs should be done on the wastewater and effluent drainage systems in case of any breakdown. Periodic check-ups should be done to ensure that foul water systems are in sound position. Management of the facility is encouraged to engage competent service providers in waste collection, housekeeping and facility maintenance services.

Overall impact significance with mitigation: Minor

Table 9: Summary of Impact Analysis (Impact Matrix Table)

Impact	Extent	Magnitude	Duration	Probability of occurrence	Overall significance without mitigation	Overall significance with mitigation
Construction phase						
Soil Erosion impacts	Site specific	Low	Temporary	Probable	Minor	Minor
Impacts of noise and Vibrations	Site specific	Low	Temporary	Probable	Minor	Minor
Impacts on Air quality	Site specific	Low	Temporary	Probable	Minor	Minor
Poor Sanitary Waste	Local	Medium	Temporary	Probable	Moderate	Minor
Management						
Impact of Fuel and Oil Spills Contamination	Site Specific	Low	Temporary	Probable	Moderate	Minot
Impacts of construction solid waste	Site specific	Low	Temporary	Highly probable	Minor	Minor
Degradation of material source points	Site specific	Low	Temporary	Probable	Minor	Minor
Loss of secondary vegetation cover	Site specific	Low	Permanent	Highly probable	Moderate	Minor
Occupational health and safety impacts	Site specific	medium	Temporary	Probable	Moderate	Minor
Community Health and Safety impacts	Site specific	medium	Temporary	Probable	Moderate	Minor
Traffic Interference and accidents	Local	Low	Temporary	Probable	Minor	Minor
Security	Local	Low	Temporary	Probable	Minor	Minor
Disruption to work	Site specific	Low	Temporary	Highly probable	Minor	Minor
Operation phase						
Impacts of poor solid waste management	Site specific	Medium	Long term	Highly probable	Moderate	Minor
Pollution from wastewater from human	Local	Medium	Long term	Highly probable	Moderate	Minor
occupancy						
Pressure on water consumption	Local	Medium	Long term	Highly probable	Moderate	Minor
Pressure on energy consumption and control	Local	Medium	Long term	Highly probable	Moderate	Minor
Likelihood of fire outbreaks	Site specific	Medium	Long term		Moderate	Minor
Possibility of Natural Hazards	Site specific	Medium	Long term	Improbable	Moderate	Minor
Likelihood of collapse of structures	Site specific	Medium	Long term	Improbable	Moderate	Minor

8 ENVIRONMENTAL AND SOCIAL MANAGEMENT AND MONITORING PLAN

There is need for a monitoring process put in place to check the progress and the resulting effects on the environment by the planned project. The process begins during the construction stage and continues through the operation phase. Monitoring determines the effectiveness of recommended mitigation measures and includes regular reviews of the impacts that cannot be adequately assessed before the beginning of the project, or which arise unexpectedly. In such cases, appropriate new actions to mitigate any adverse effects should be undertaken.

Uganda Revenue Authority as the major beneficiary of the BP's establishment shall be in charge of management and monitoring of potential impacts during the operation of the BP. Ministry of Works as the implementer as well should work hand in hand with URA to ensure that the operations at the BP in the operational phase are carried out in an environmentally friendly manner.

The management plan will present an overview of the considerations to be taken into consideration during the design, construction, operation and maintenance phases.

Environmental activities to be monitored

- Restoration of gravel sites;
- Monitoring of contamination from fuel/oil spillages especially on land;
- Efficiency of erosion control measures;
- Management of body waste and general sanitation at the BP;
- Availability of first aid facilities and emergency readiness; and
- Management of dust and noise source points.

Social Activities to be monitored

- Culture heritage and the disadvantaged;
- Resettlement of the current Bonafede owners and those squatting on the site;
- Community Health and Safety;
- Influx;
- Occupational Health and Safety Issues for workers;
- Local employment;
- Impacts of Noise and dust pollution;
- Use of personal protective gear during construction and operation;
- Pressure on existing health infrastructure;
- Spread of diseases especially HIV/AIDS and Ebola
- * Road safety measures in place and their impact on the road;
- Changes in land use and resultant effects must be monitored;

Environment Management Plans provides a link between the mitigation measures or enhancing attributes put forward in the assessment report and the integration of these measures during the design, construction and operation phases. They provide details of impacts, measures to mitigate the impacts, whose responsibility, time frame and the cost of mitigation. Therefore, the above has to be incorporated in the planning phase early enough to ensure that they are taken care of.

Next pages are the Environmental Management Plan / Environmental Social Monitoring Plan for Bunagana BP to be implemented.

Table 10: Environmental and Social Management and Monitoring Plan for Bunagana One Stop Border Post

Management				Monitoring		
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility
General Requirements						
Environmental and Social Management	MOWT and the Contractor will regularly review and update as required the ESMMP and SEP to ensure it is responsive to changes in project circumstances.	Throughout project life	Contractor	Updated ESMMP and SEP	Every quarter throughout project life	MOWT
Applicable Standards	The project will be managed, constructed and operated in a manner that is complaint with applicable national, international law and Conventions, and relevant National requirements, policies and guidance.	Throughout project life	Contractor	Monthly compliance status demonstrating compliance with national regulations laws and policies	Monthly throughout project life	MOWT
Applicable Project Documentation	MOWT and Contractor will implement and comply with all the measures specified within the relevant project Documentation, including: - ESMMP - Stakeholder Engagement Plan (SEP) - Resettlement Compensation Framework (RCF) - Project contractually binding documents, including the Employer Requirements - Environmental and Social Impact Assessment/ Statements and related Decisions from the competent ministries/ authorities such as NEMA, BTC and MOWT	Throughout project life	Contractor	Monthly and Quarterly reports demonstrating compliance with environmental and social requirements	Monthly and quarterly throughout project life	MOWT
BP Environmental & Social Resources & Organisation	 MOWT will establish within its organisation the environmental & social management capacity and capability to undertake the following: Reviews of the environmental and social performance of its contractors and suppliers during BP construction and operation; Co-ordinate the implementation of actions/ measures under the ESMMP which are the responsibility of BP; Regular reviews of compliance with the ESMMP obligations; and Review and update to ESMMP to ensure it reflects project circumstance and still complies with NEMA Requirements. 	Throughout project life	Contractor	Established sufficient environmental and social management capacity and capability for each phase.	Monthly	MOWT

Management				Monitoring			
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility	
Environmental & Social Manage	ment Systems						
	As part of the Site Management Plan the Contractor will develop and implement a Construction Environmental & Social Management System (CESMS) to support the Implementation of the ESMMP & SEP and support good environmental & social management practices. The CESMS will be developed and implemented in-line with international standards including:		Contractor	Presence of a functional CESMS	Throughout construction phase	MOWT	
	 Organisation, responsibilities and resources (including commitment that critical ESHS positions will be identified and maintained); 						
	 Construction Environmental & Social Management Plan, including supplementary plans (e.g. Waste Management Plans, Hazardous Materials Management Plans); 						
	 Procedure which assesses ESHS risks; 						
	Monitoring Plan;						
	Emergency Preparedness & Response Plan;						
	 An audit process and programme (including performance audits, audits on labour & working conditions); 						
	Training programme; and						
	Reporting of Environmental & Social performance.						
	The Contractor shall appoint an appropriately qualified Environmental, Social, and Health & Safety (ESHS) Manager who will be responsible for the development and implementation of the CESMS and co-ordination to ensure the provisions of the ESMMP are complied with.						
	The ESHS Manager shall have appropriate qualifications, and resources. The ESHS Manager shall have assigned responsibilities including, but not limited to: • Implementation of the ESMMP;						

Management				Monitoring		
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility
	 Implementation and co-ordination of Construction Environmental & Social Management Plan and associated management & mitigation plans; 					
	 Preparation of quarterly reports for compliance with ESMMP (and other applicable standards/documents) and related to CESMS and Construction Environmental & Social Management Plan; 					
	Managing an incident reporting system (including near- misses); and					
	Preparation and submission of environmental monitoring reports to MOWT as required by NEMA which will include review of compliance with ESMMP obligations.					
Operational Environmental & Social Management System (OESMS)	·	Phase	MOWT	Presence of an OESMS prior to commissioning and operating of the BP	During Operation	MOWT
	 Organisational, responsibilities and resources; Operational Environmental & Social Management Plan, including supplementary plans e.g. Waste Management plans, Hazardous Materials Management plans, etc.; Operational Monitoring Plan; Emergency Preparedness & Response Plan; 					
	 An audit process and programme, including performance audits and BP safety audits; Training programme; and Reporting of Environmental & Social performance. MOWT shall appoint a qualified ESHS Manager who will be responsible for the development and Implementation of the OESMS and co-ordination to ensure the provisions of the ESMMP are complied with. The ESHS Manager shall have appropriate qualifications, training, authority & responsibility and resources. The ESHS Manager shall have 					

Management		Monitoring				
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility
	 Implementation and co-ordination of OESMS (and associated audits, corrective action, etc.); Implementation of the ESMMP; Implementation and co-ordination of OESMP (and associated management & mitigation plans); Preparation of quarterly reports for compliance with ESMMP (and other applicable standards/documents) and related to OESMS; Managing an incident reporting system (including near-misses); and Preparation and submission of environmental monitoring reports to BP and reports as required by NEMA which will include review of compliance with ESMMP Obligations. 					
Site Management Plan (SMP)	Preparation and implementation of Site Management Plan for construction, including inter alia: Location of borrow pits and inert waste landfills to be used; Location of batching and crushing plants and construction camps; Haulage routes; Site Clearance plan; Construction Travel Plan (including volume and type of construction vehicles etc) & Traffic Management; Location of workforce accommodation camps; and Security plan	During Construction Phase	Contractor	Presence of an SMP in place prior to construction. Draft SMP to be provided for review by MOWT within 30 days of award.	Monthly and quarterly throughout the project life.	MOWT
	Within the Site Management Plan the contractor must demonstrate how they intend to ensure clear delineation of the 'Project Area' (i.e. site) to ensure construction activities (including site clearance, movement of machinery & vehicles					

Management				Monitoring			
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility	
	etc.) do not go outside specified area approved in main design.						
Sub-/ Supplier Management	The BP Contractor/Operator will apply contractual agreements for securing services of sub-contractors and suppliers, which ensure they are obliged to comply with all environmental and social requirements contained with applicable project documentation and standards. The Contractor/Operator will advise their sub-contractors and suppliers of their Environmental, Social, Health & Safety (including Labour& Working Conditions) responsibilities, including relevant requirements within the ESMMP. Applicable ESHS requirements shall be contained within contractual agreements, including the requirements for sub-contractors to pass requirements to any of their subcontractors and establish provisions for EHS reporting.	_	Contractor	Contractual agreements of suppliers	Throughout Construction Phase	MOWT	
Social-economic requirements							
Stakeholder Engagement	MOWT shall maintain and implement a Stakeholder Engagement Plan (SEP) and grievance mechanism relevant for each phase of the project to ensure that all stakeholders are identified, that sufficient information about issues and impacts arising from the project (e.g. construction impacts) and proposed mitigation are disclosed in a timely manner and that all stakeholders are consulted in a meaningful and culturally appropriate way throughout project implementation. Determine whether any vulnerable / disadvantaged groups or communities are likely to be disproportionately or permanently and adversely affected by the Project and identify and implement appropriate communication methods to consult with them about mitigation measures. Contractors shall adopt the SEP and grievance mechanism principles and requirements within their own management.	During construction phase	Contractor	Stakeholder Engagement Plan and Operational grievance mechanism in place before construction begin.	Planning, Construction & Operational phases	MOWT	
	Contractors shall adopt the SEP and grievance mechanism principles and requirements within their own management Systems as appropriate, and provide training to staff on the SEP requirements.						

Management		Monitoring				
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility
	MOWT will aim to involve stakeholders and to keep good communication practices during the lifetime of the project through its PR Division. Their Objectives will be:					
	 Providing local communities with a project schedule and information on project activities that may affect them, together with mechanisms for their feedback Provide general information to improve knowledge of what the project involves, with all stages and expected performance 					
	To make available to the public a grievance procedure, in order to collect, respond and resolve issues and complaints on a timely basis (30 days)					
	Stakeholders to be affected include timber dealers, URA, Business community among others.					
	For each of the stakeholders defined in the SEP communication tools suggested will be					
	used in order to ensure easy, transparent, direct, open and interactive communication with all stakeholders.					
Construction Phase Impacts						
Soil Erosion	Storm water check dams or impact dissipaters in the side drains shall be introduced.	Construction	Contractor	Status of check dams in drains	During Construction phase	MOWT
	Storm water retention ponds shall be established along the drainage channels to retain any run-off from the site. Later the area shall be grassed. Regular maintenance of this infrastructure should also be undertaken.	Phase				
	Raised embankments along the excavated area should be vegetated after the construction works or stone pitched to stabilize them and deter soil erosion.			Status of raised embankments along excavated area		

Management		Monitoring				
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility
	Excavations should be undertaken in required areas only so that land that is not required for purposes of BP with the associated components construction is not disturbed.					
	Earth works should be undertaken during the dry season to reduce on the possibility of soil being washed down the slope.			Extent and timing of excavations		
	Topsoil excavated during site stabilization should be used to restore marram quarries or landscaping/backfilling lowly placed sections of the site.					
	Sedimentation and Erosion Control Plan, will be developed in order to identify specific erosion control techniques for use at particular sites along the BP alignment. The plan will be based on several principles and approved by MOWT prior to construction:			Final management of top soils after excavation		
	 Site characteristics (topography, soils, drainage patterns, and covers) will be considered when developing the plan. Areas which are prone to erosion will be left undisturbed and undeveloped if possible. Entrance and exit points for runoff will be protected from erosion and equipped with sediment control devices. Minimise the extent of the disturbed area. Typically, if an area is not going to be worked on in more than 30 days, it will be protected by erosion control mats. The use of heavy equipment and techniques that will result in excessive soil disturbances or compaction of soils will be minimised, especially on unstable slopes. The drainage and runoff controls will be established before starting the site clearance and earthworks. The existing vegetation will be retained as much as possible. Where water would need to be removed from excavations, it will be transferred at the minimum practical distance to be discharged. Concentrated flows if possible, will be diverted away from sensitive areas. Sediment control devices such as sediment control ponds will be used to retain sediments from leaving the 			Preparation and Implementation of the sedimentation and erosion control plan minimise the loss of soil.		

Management	Management			Monitoring			
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility	
	site. • The most effective erosion control devices will be implemented: Sediment control devices to be implemented will include; i) site fencing; ii) straw bales; iii) sediment basin /traps; iv) storm inlet traps; v) rock check dams and vi) interception berms/swales. • Once construction is completed at a site, the decomposition and restoration of the disturbed areas that are not to be occupied by permanent structures will be carried out by tilling the land before proceeding to the vegetation reinstatement.						
Noise and Vibrations	 All construction equipment will comply with the requirements National Standards on noise emissions in the environment by equipment for use outdoors. The equipment will be fitted with appropriate noise muffling devices that will reduce sound levels. As the project activities are performed, (in several noise level areas, according to the national legislation), every effort shall be carried out to comply with the corresponding noise limits for each area. Construction works shall not be permitted during the night; the operations on site shall be restricted to the period 7.00-19.00 h. All vehicles and machinery used at the construction sites shall be subjected to regular maintenance. The vehicles and machines that are excessively noisy due to poor engine adjustment or damaged noise control devices shall not be operated until corrective measures have been taken. The construction traffic plan shall establish speed limits for construction vehicles and machinery at the construction site and the haulage roads used, and organize traffic so as to avoid as much as possible populated areas. Affected local residents will be kept informed on due time of the planned works and the vibration and noise levels and periods during which they will occur. The location of noisy equipment will be chosen as far as possible from sensitive receptors (houses, workplaces, schools and hospitals). When near sensitive receptors, constructions will be scheduled 	construction phase	Contractor	Daily Records of noise and vibration levels at sensitive receptors Records of vehicle and equipment servicing. Activity scheduling that minimises impact of noise. Community complaints on noise and vibrations. Number of nearby buildings damaged by vibrations from site.	At start up and then monthly during construction	MOWT	

Management				Monitoring			
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency Monitoring	of Responsibility	
	 Good management practice will be used to distribute heavy noise equipment along the route so as to avoid the cumulative effects of noise. In the case where noisy works would need to be performed at night or during a longer period than a day at a given site, a noise shield be erected around the working area. Monitoring of vibrations during the performance of critical work processes (e.g. foundation of BP) should be undertaken in building which are within a distance of 20-30 meters from the area where these works take place. Should buildings result damaged as a result of vibrations generated by the construction works, the damaged buildings will be repaired or compensation paid. Operate earthmoving equipment on the construction site far away from vibration-sensitive receptors as possible. Activities such as demolition, earthmoving and ground-impacting operations shall be scheduled so as not to occur in the same time period. Unlike noise, the total vibrations level produced could be significantly less when each vibration source operates separately. Decrease vibrations from construction sources, including: Blasting. Explosion type and weight, delaytiming variations, size and number of holes, distance between holes and rows, methods and directions of blast initiation Dynamic compaction. A smaller falling weight will produce smaller vibrations. Pile driving. Predrilling, pre-setting, replacement of displacement piles with non-displacement ones, switch impact hammer to vibratory one, replacement of driven piles with augured cast in-place piles or drilled shafts. Select demolition methods not involving vibration impact, where possible. A detailed BP noise and vibration study will be completed during the development of the detailed design of the BP project to determine the specific 						

Management				Monitoring	Monitoring			
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility		
	and optimum noise abatement measures to be taken. • Proposed Noise mitigation measures leading to the decrease of noise exposure include measures implemented at the source of noise and measures that intercept the noise reduction between the source and the receptor: At the source: • Use power generators with canopy • Noise barriers (protective walls) with noise reduction potential by 15-15 dB (A). • Insulation of house windows and façade with noise reduction potential by 10-30 dB (A).							
Impact on ambient Air Quality	 Regular sprinkling of water along stretches under construction and routes used to deliver construction materials during the construction phase should be undertaken in a manner that effectively suppresses dust. Trucks delivering construction materials such as sand and murram and gravel should be covered with tarpaulins and once the construction activities are over, there will be limited dust pollution if the driveways and parking yard are paved. The construction site will be hoarded off to restrict dust to the site boundaries only. 	Construction	Contractor	Presence of a functional Dust Management Plan Dust present on vegetation and structures neighbouring the site Visual checking of dust emissions from construction sites.	Monthly during construction works involving earth movements. Increased frequency during dry season.	MOWT		
	 dust to the site boundaries only. Construction workers will be provided with protective respiratory equipment like dust masks where need be. Vehicles and other equipment on site should be in good condition to limit localized emission releases to the environment; Careful driving should be the norm and observed by truck drivers hence they should limit their speed Periodic automobile maintenance especially for those on site will be important in reducing the production of un-burnt carbon to the surrounding. Ducts to be used to direct debris from upper floors 			Monthly and Quarterly air quality reports				

Management				Monitoring	Monitoring			
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	f Responsibility		
	Accesses and construction sites will be kept moist to reduce dust formation.							
	Water sprays will be implemented during drilling and excavation activities.							
	 In the dry season, hygroscopic additives will be used in water to increase its presence in the ground. 							
	 Dust generating activities will be slowed down in days of strong winds. 							
	 In windy and dry conditions, earth stockpiles will be moistened to prevent the lifting of dust particles. 							
	Ground will be moistened during loading and unloading of aggregates in trucks.							
	 Loaded trucks will be washed down prior to exit from working site to ensure that loose material is not tracked onto the roads. 							
	 No unnecessary idling of construction vehicles at the construction sites will be allowed. 							
	Construction truck traffic will be optimized so as to get a minimum number of trucks							
	 Carrying the maximum volume of materials. This will be addressed in the construction Traffic Management Plan. 							
	The truck routes will be planned to avoid peak traffic hours or routes with heavy							
	• traffic.							
	 Regular maintenance of the diesel locomotives will be performed to keep them in optimal working conditions, including the achievement of minimal air emissions set by the manufacturer. 							
	Every effort will be made to use the cleanest fuels within technically feasible possibilities.							

Manag	ement					Monitoring			
Impact	:/ Aspect		Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility	
Poor Manag	Sanitary ement	Waste	Sanitary waste should be properly disposed of to avoid unsanitary and unhygienic environs around the project site.	During construction	Contractor	Presence of adequate gender sensitive sanitary facilities at the site	Weekly Supervision by Local Authorities	Local Authorities	
			There will be mobile toilets for body waste disposal to avoid contaminating the neighbourhood and ground water with facial matter during the construction phase.			Sanitary facilities clean	Monthly Supervision	MOWT	
			Once the project becomes operation facial matter will be handled by the planned centralized system comprising of septic tanks and soak pits. Wastewater pipes and sumps will be newly constructed. Pipe work will be subjected to periodic inspection.						
•	of fuel and onination	oil spills	Extra care should be taken while refueling trucks and equipment to avoid fuel spills. It is in the interest of the BP developer and the contractor not to spill any fuel as this implies loss of income.	During construction	Contractor	Presence of a functional Oil spill management plan	Monthly and quarterly	MOWT	
			When servicing the equipment measures should be put in place to undertake effective disposal of the used oil or any oil wastes.			Presence of oil spill kits at the site Contract with licensed hazardous waste handler			
			 Servicing of construction vehicles should be undertaken from designated areas like service garages. Well- serviced equipment reduces emissions of noxious fumes (carbon dioxide, carbon monoxide, nitrogen oxides, sulphur oxides). 			Water quality analysis reports from nearest downstream spring well.			
			Potentially polluting materials, such as fuels, oils, chemicals and associated liquid waste materials, etc. will be stored in dedicated, segregated storage areas, with spillage protection and appropriate environmental security measures to prevent accidental release to ground during storage.						
			 In addition, appropriate working procedures will be adopted to minimise the risk of accidental release 						

Management		Monitoring				
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility
	during delivery to and removal from the storage areas. Working procedures will ensure that these materials (raw and waste) are handled correctly. Working procedures will seek to prevent accidental release during the use of these materials, for example, vehicle refueling and plant maintenance, especially with regard to waste oil. • Procedures will be adopted to minimise the					
	potential for accidental discharge of pollutants during the washing down of equipment and vehicles.					
	 All roads and hard standings will be kept clean and tidy to prevent the build-up of oil and dirt that may be washed into a watercourse or drain during heavy rainfall. 					
	 Oil spill kits will be availed at the construction sites in case there is an accidental spill, so that it can be immediately cleaned up. 					
	 Vehicles and construction machinery will be subject to regular preventive maintenance so as to reduce leakages of lubricants, motor oil and fuels. 					
Improper Management of Solid Waste (Construction Debris/ Demolition Waste)	 A site waste management plan should be prepared by the contractor prior to the commencement of construction works. This should include designation of appropriate waste storage areas, collection and disposal schedule to approved dumping sites. 		Contractor	Presence of a functional waste management plan.	Monthly	MOWT
	 Special attention should be given to minimizing and reducing quantities of solid waste produced. 			Number of approved dumping sits for construction debris		
	Use the excavated material for backfilling.					

Management		Monitoring				
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility
	 Provide waste bins for proper waste storage. Generated waste that can be re-usable will be sold 			Records of amount of waste disposed per month		
	 or given away to interested parties. In all, waste management will be addressed through 					
	waste management system that addresses issues linked to waste minimization, generation, transport, disposal, and monitoring. The developer/contractor will endeavour to implement systems towards these waste management systems.					
Degradation of material Source points	The operators of murram gravel quarries should have a management plan for them and during their operation water stagnation should not be allowed to take place.	Before and during construction	Contractor	Availability of ESIA certificate for borrow pits and quarry sites where material is to be extracted.	During construction phase	MOWT
	After use of the quarry, proper landscaping should be undertaken to improve the aesthetic value of the area.			Decommissioning plan for borrow pits and quarry sites.	Before, during and decommissioning of material extraction sites.	
	The quarry should be fenced off to avoid accidental fall over from the quarry flanks.				sites.	
	The contractor should procure from those having a management plan for their quarries.					
	In addition, the law requires that opening up of borrow pits and quarry sites should have independent detailed environmental and social impact assessment and approved by NEMA. This assessment shall guide on the proper management of material source points and thereby reduce potential impacts.					

Management			Monitoring			
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility
	Emphasis will be put on ensuring that hard core and other stone aggregate materials are purchased from those obtaining them in a friendly way.					
Loss of Vegetation Cover	Only vegetation within the areas to be developed shall be removed during clearing but no grown tree species shall be eliminated. The minimal vegetation that will be cleared will be compensated with the greenery to be introduced after construction works.	During demolition and construction	Contractor	Extent of vegetation cleared Types of trees and ornamental plants replanted	During and after construction	MOWT
	Proper landscaping shall be done with planting of ornamental trees and flowers done thereafter. This shall improve the aesthetics of the BP.					
Occupational Health and Safety Impacts	The works contractor will take measures to provide Personal Protective Equipment (PPE) to the construction workers like helmets, gumboots and overalls to help limit injuries during construction.		Contractor	PPES issuance records Number of accidents and injuries per month	Before the start of the project activities and every working day during construction phase	MOWT
	 Contractor/proprietor will provide well stocked first aid kit for the work force to cater for minor cases prior to any referrals to health centres or hospitals. 			Number and condition of first aid boxes on site		
	 The contractor will put in place proper guiding and appropriate educative signage at the site to keep the work force aware of their obligations and the general public aware that there is construction work in progress and appropriate precaution to be taken while at the site. 			ESH training records and schedules		
	 Close supervision of work, including the provision of appropriate training for the workforce in observing better construction practices and handling emergency cases will be given priority and undertaken. 			Monthly reports on safety		

Management		Monitoring				
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility
	 The hoarding should be tall enough to avert any falling debris and other remains that may harm the public. The contractor should ensure that only trained 					
	 Guidelines and regulations on site safety should be communicated to all workers, suppliers, sub- contractors and residents. 					
	 All other measures as found appropriate to keep the workers and other people free from OSH hazards will be undertaken by the contractor in collaboration with the developer. 					
Community Health and Safety	The developer will engage the resident neighbours and area local leaders prior to commencement of the project. This helps in ironing out their grievances, ensures project ownership by the community and fosters cooperation.	Construction	Contractor	Presence of a community grievance redress mechanism that is functional Presence of a functional community health and safety plan	Prior to the start of the construction phase daily checking of construction site boundaries.	MOWT
	 The developer and contractor will employ mainly area residents during the construction to minimize any form of social order disruption through influx of migrant labour force. 			Approved Traffic Management Plan in place		
	 Working hours during the construction phase will be restricted to daytime since the project has a component of residences to avoid any interruptions to the neighbours especially during night. 			Functional Community Health and Safety Educational Programme that continuously sensitizes communities.		
	 Any form of misunderstanding will be amicably solved with the help of local leadership. Safety signage shall be installed at the site and along the road to guide communities on safety aspects during the project construction. 			Nature and frequency of conflicts between workers and local communities. Number of employees not from the project communities.		

Management				Monitoring		
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility
	 (H&S) Plan has been adequately developed by the Contractor and approved by MOWT Representative Traffic Management Plan will be developed for the safe use of vehicles on and off site; driving standards; safe access to construction sites with 					
	minimum negative impact on the existing roads and in parallel for ensuring community safety and easy access to their properties (homes, land and gardens). Workforce transportation should be considered within TMP.					
	 A construction community Health and Safety Educational Programme will be developed to inform and build awareness and understanding of the local community and drivers on the construction hazards and potential adverse impacts during the construction phase and how to minimise the potential for an accident and/or injury to occur. The Programme will be linked to the SEP and utilize various communication methods to address the needs of vulnerable groups such as children and illiterate residents. 					
	 Workers must receive training and guidance on how to avoid conflicts with the local community members and sign code of conduct, in order not to create conflicts with local government. 					
	 Any damage or grievance shall be managed by the Grievance Process and any repair/compensation be made in a timely basis. 					
	 Worker transportation and modes for workforce movements during construction works will be organised in a way that will minimise negative impacts on local residents. 					
	The design and location of structures along DRC Highway must take into account the views and concerns raised by local residents and other					

Management		Monitoring

	stakeholders, especially UNRA. Evidence of consultation with stakeholders to be retained.					
Traffic Interference and Accidents	 Proper signage will be installed at appropriate distance at diversion point to warn all road users of on-going construction activities and thus heavy vehicles. Such signs may be like "Heavy trucks turning ahead". Most of the construction materials will be 	_	Contractor	Signage along the road Presence of a functional Traffic Management Plan	Before the start of the project activities and every working day during construction phase	MOWT
	delivered to site during off peak hours when there is always minimal vehicular volume on the road or early in the morning before heavy traffic builds up to minimize traffic hindrance and delay.			Number and type of speed limiting structures in place		
	 Proper temporary road barriers such as humps will be put in place to limit speed and drivers will be cautioned to check speed. 			Number of traffic guides		
	 The developer will liaise with traffic officers to ensure adequate signage on the roads during the construction phase for smooth flow of traffic and to warn and alert other road users of the construction activities on site. 			Traffic accident log showing minimal figures		
	 Flagmen should also be employed to control traffic and guide vehicles during offloading and heavy vehicle turning. 					
	 The developer should also prepare a traffic management plan (TMP) which is a site-specific plan that covers the design, implementation, maintenance and removal of temporary traffic management (TTM) measures while work or activity is carried out. 					
Security	The construction site should be fully horded off using material such as iron sheets to prevent random access to the site by unauthorized people.	During construction phase	Contractor Hired security firm	Well trained security guards on site Number and status of accesses to site	Monthly during construction	MOWT
	The site should be given one access with a lockable gate and full-time armed security					

Management				Monitoring		
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility
	guards to monitor entry and exit of all personnel equipment and materials to and from the site. • Security cameras should be placed in strategic locations around the camp site to record all activities that happen at the construction site both day and night so as to ensure easy follow up on security cases. • Metal detectors should be installed at the entrance to the construction site to ensure that armed weapons and devices are not allowed through the gate. • Security lights should be installed around the construction site to provide illumination to the equipment and materials at the site during the night hours. • Working hours should be restricted to the day time so that only security guards are expected to be at the site during the night time. This will reduce on the potential of work activity in the night and thereby reducing the risk of theft at the site.			Presence and location of security cameras at site Record of security cases at the site Number of police cases regarding the site		
Loss of working and boarding space	The URA as the sole owner of the land housing the proposed site for the border posts, has got a number of other structures at the site, apart from the one to be refurbished, in which they currently reside. During the refurbishment of the structure, URA shall move into other structures within their premises temporarily until the redevelopment of the existing structure is done. After completion of the redevelopment, the URA and other agencies under their property shall move into the completed structure and the other smaller structures shall as well be demolished as per the project plan.	-	MOWT	URA staff having designated areas to work from.	Throughout the construction phase	MOWT

Management				Monitoring			
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility	
Gender Based Violence and Violence against Children (GBV and VAC)	 Include in contractor's contract a provision on observing the code of conduct to prevent GBV. The contracts of the staff of the contractor should include a clause on the GBV as elaborated under Codes of conduct attached in Annex 5. Train and create awareness to Contractors staff and workers on what GBV and VAC is, responsibilities, penalties and redress mechanisms. Create awareness to the vendors and the communities using printed materials and radio programs in local languages to enable them understand gender-based violence; their rights, responsibilities and redress mechanism. Work with the communities, the Local Council, and vendor's/ trader's association to ensure that any GBV case is quickly identified and addressed. Work with the District and the Police to ensure any cases that are registered are addressed as quickly as possible and in a manner that provides justice to the victim. Increase representation of special interest groups on grievance redress committees, Joint Border Committees and Cross Border Trade Associations. Establish a feedback mechanism to monitor activities of the contractor's staff on and outside the site to ensure compliance with the code of conduct. Strengthen risk assessments and use them to trigger action: The project will be mindful on how the SEA/GBV risks can be monitored, on a continuous basis through the life of a project; SEA/GBV specific risk assessment /analysis methodologies Educate and raise the awareness of women, adolescents and children of SEA and their legal rights and potential risks. This will among others, 	construction phase	Contractor	Codes of conduct on GBV and VAC signed by all project personnel. Training records on GBV and VAC on site and in the community. Number of complaints from community on GBV and VAC	Regular monitoring on a monthly basis or, as and when a case of a grave magnitude occurs.		

Management		Monitoring				
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility
	include the matters related to the influx of labour associated with a project and made aware of the laws and services that can protect them and provide redress in case of an incident.					
	a) Children/ minors: identify and support appropriate local community institutions/expertise to consult with children;					
	b) one of the mitigation measures is for CSOs with expertise in child abuse and the sexual exploitation of children as well as those with expertise in project-related risks e.g.: Health services, psychosocial support, security and access to legal services.					
Grievance Handling and Redress Mechanism	Two grievance redress mechanism shall be put in place, one for the general public to report issues on the project and another grievance redress mechanism for workers to report labour and working condition related cases.	During construction phase	Contractor	Presence of a grievance redress mechanism that if functional on site Grievances register with filled in	Regular monitoring on a weekly basis or, as and when a grievance is registered.	MOWT
	Both GRM should make provision for escalation of unresolved issues and depending on the nature of the grievance. GBV/VAC should be referred to relevant agencies lie police, health facilities or CSOs in the area that handle GBV/VAC related issues.			Number of grievances that are still pending and not closed		
Social Order Disruption (Disturbance to Public)	Advance warning on the impending construction activities should be given to the communities in the immediate proximity of the site and the material delivery routes.	During construction phase	Contractor	URA offices shifted before commencing construction works	Before Construction begins	MOWT
	URA Staff residing on site will also be temporarily disrupted in addition to customs services to the business community. Informative signs should be put in place to guide road users or communities in the proximity.		URA			URA
	In areas with heavy vehicular traffic during the normal working days, work should be undertaken during off-peak hours. Use of flag men to guide traffic should be promoted.					

Management				Monitoring		
Impact/ Aspect	Mitigation /Enhancement Measures	Timeline	Responsibility	Targets/Parameters to Monitor	Frequency of Monitoring	Responsibility
	URA staff shall be accorded ample time to move into the already existing empty shelters on the property. This shall be done is a phased manner to ensure minimal disruptions in the normal service delivery at the border post. Arrangements are being made to ensure smooth relocation of current business undertakings on site before start of construction works. There will be no need of a RAP.					
Operational Phase Impacts						
Impact of poor waste management	 Waste collection bins will be provided at strategic positions at the structure for temporary waste storage. The waste collection bins shall be provided with covers to avoid spillage by scavengers; 	Throughout the operation phase	URA	Number and location of waste bins at the BP	On a daily basis during the operation	URA MOWT
	The waste bins shall be well labelled to enable segregation of the wastes			Labels on the waste bins		
	 Coded litterbins shall be provided at the building with a provision for sorting the wastes according to their composition (biodegradable and non- biodegradable wastes) to allow activities of recycling and reuse.; and 			Certificate of the licensed waste handler.		
	 Arrangements will be made to hire a certified waste collection company to transport the waste for final disposal to designated waste dumping sites approved by NEMA. 			Complaints from community on waste management		
Pollution from waste water from human occupancy	 Well-designed plumbing system will be installed to collect all the wastewater from washrooms and toilets to the septic tanks for effective treatment and final disposal; Ensure prompt emptying of the septic tanks once it's full to avoid overflow into the nearby environment causing pollution. Routine quarterly maintenance should be done to 	phase	URA	Foul odour around the facility Ground water tests showing presence of ecoli. Records of quarterly checks for the sewer system.	Monthly during operation of the BP	URA
	 ensure there are no leakages in the sewer system to ensure no seepage of waste water into the ground. Periodic maintenance regime for the plumbing system will be put in place and implemented to 			Sever system.		

Management		Monitoring

	If found lacking the contractor will be made to comply with the required standards or have the contract cancelled and a credible contractor taken on. Supervision of works will be undertaken by a certified firm, and the site Engineers should have membership of renowned certification agencies. Ensure not to exceed the stipulated loading onto the structure to avoid collapse.		URA	Loading subjected onto the structures	During operation phase		

9 MAIN FINDINGS AND RECOMMENDATIONS

A number of environmental and social impacts will result from the establishment of this BP. Major issues of concern include; pollution due to dust, noise, oil leakages, sediments, increased storm water generation as a result of the paved surfaces, earthworks.

Sensitive issues have been identified, mitigation measures to address the issues recommended and an environmental management and monitoring plan suggested to allow best management practices within the construction and operation phases.

No alternative to the project was considered since the proposed development is suitable with the area land use and planning provisions in addition to being and upgrade/expansion of the existing facility, however the project design was studied to ensure that it has put into consideration the safety and environmental aspects before execution of the project. Such included provisions for use by the physically handicapped, presence of fire escape routes, availability of adequate vehicle parking facilities commensurate with the commercial useable space available, provision for effective evacuation of generated wastewater, and suitability of the soil profile where to execute the project among others.

The area is characterised by commercial undertakings as the proposed development which makes the project compliant with area land use and planning provisions. Guidance should be provided during the execution of the project as is the case on other establishments to ensure it complies with the engineering, environmental and regulatory planning provisions. The proposed BP development is to be developed in an area zoned for mixed-use developments.

The project site is adequate enough to accommodate the proposed project in the current magnitude and general development safeguard measures have been proposed to ensure implementation of the project in harmony with the neighbourhood. The proposed BP development process is environmentally and socially acceptable considering that this is a World Bank Category B project ("Projects requiring environmental analysis") where the foreseen adverse impacts can easily be mitigated and the developer is committed to ensuring that implementation of this project does not cause injury to the environment. Care must be taken to ensure that the existing adjacent infrastructure especially privately-owned commercial buildings, roadside constructed storm water drainage system along the highway to DRC is not interfered with and the best engineering practises are put to use.

The concerted view of the consultancy team is to allow the project to be implemented in the proposed way (design and magnitude) on condition that MOWT and the primary users implements the identified mitigation measures and undertakes to monitor all the key areas identified in the report.

Appendix 4: Cultural Resources Chance Finds Procedure

CHANCE FINDS PROCESURE

1, DEFINITIONS AND ABBREVIATIONS

MOWT	Ministry of Works and Transport
СМ	Contractor Manager.
LC	Local Council
IFC	International Finance Corporation
Cultural Heritage Property	Movable or immovable objects, sites, structures, groups of structures and unusual natural features and landscapes that have archaeological, paleontological, historical, architectural, religious, aesthetic or other cultural significance. Physical cultural resources may be located in urban or rural settings and may be above or below the ground or under water. Their cultural interest may be at the local, provincial or national level or within the international community.

2. PURPOSE

The purpose of this procedure is to ensure the protection of sacred sites and underground cultural heritage property within the project area including potential archaeological finds discovered during the construction phase of the BP project.

3. POLICY, LEGALAND REGULATORY FRAMEWORK.

No	Title
1.	Uganda Historical Monuments Act (Cap 46)
2.	The Uganda National Culture Policy 2006.
3.	WB Operational Manual -OP4.11 Physical Cultural Resources.
4.	IFC Performance Standard 8 Cultural Heritage.
5.	The Uganda Constitution

4. ROLES AND RESPONSIBILITY.

MOWT and contractor personnel operating within Bunagana BP project are responsible for the application of this procedure.

a) Ministry of Works and Transport

107

MOWT guarantees the availability of the economic, human and technical resources needed to ensure that cultural property resources are preserved and protected.

b) Contactor Firm.

It is the responsibility of the manager of the company contracted to build the BP to ensure that during excavation and construction of the BP, all discovered cultural heritage property is preserved.

c) Contractor Supervisors.

The supervisors are the competent persons acting for the Contractor Firm. They are the technicians who supervise the excavations and other construction works. They must report to The Contractor Manager (CM) any discovered archaeological finds.

d) Foremen.

These report to the supervisors and lead the workers in carrying out their duties.

e) Workers.

These carry out the tasks as directed by their foremen.

5. ARCHAEOLOGICAL ARTEFACTS and CULTURAL CHANCE FINDS.

During the period of the construction of the project infrastructure which involves excavations, it is possible that chance finds will be encountered. These may include the following:

- Archaeological heritage which has remained unnoticed in the past.
- An encounter with a grave containing human remains which the local residents may have not mentioned at the survey stage and
- An encounter with a sacred site which was not mentioned at the survey stage

In order to avoid potential damage to cultural property discovered during construction, the following will apply:

- i) Workers must be vigilant to any relics found during excavation. In case of a discovery during the excavation, workers must immediately report the findings to the foreman.
- ii) The Foreman must stop the work immediately and communicate the findings to the Supervisor.
- iii) The supervisor then communicates the findings to the Contractor Manager.
- iv) The Contractor Manager then notifies MOWT headquarters.
- v) The Department of Museums and Monument of Uganda will then be notified either via communicating with the MOWT via telephone or email or based on a site visit within 14 days from the time of discovery.
- vi) Any further excavations or continuation of the infrastructure development at the Site of the discovered heritage will be undertaken only with the approval of the Department of Museums and Monuments.

- vii) Should the Conservator of Antiquities from the Department of Museums and Monuments confirm that the discovered resource falls within the heritage resource description, he/she will report the resource to the Minister of Tourism, Heritage and Antiquities for preservation and protection. Rescue excavation or in-situ conservation will be proposed based on the disturbance likely to be caused by the project or in relation to cost versa via value of the heritage resource;
- viii) The MOWT will then apply for either an excavation or preservation in-situ license of the discovered resource. The feasible proposal will then be executed. In case of in-situ conservation, the site will be managed and open to the communities and tourists that access the project area; and
- ix) All chance finds will be recorded in the chance find form.

The project activities will then continue after the following have taken place:

- In the case of archaeological artefacts discovery, MOWT will inform the Uganda Museum and grant a period where specialists from the Department of Museums and Monuments excavate and curate the artefacts professionally.
- In the case of discovered human remains the police will have to be notified and either the remains
 are taken for forensic investigation or the LCI authorities sanction the burial of the remains at
 another location. The Contractor then meets the relocation and reburial expenses.
- In the case of an encounter with an unknown sacred site, relocation ceremonies will be undertaken by the custodians of the site and the contractor then meets the relocation expenses.

Appendix 5: Codes of Conduct and Action Plan for Implementing ESHS and OHS Standards, and Preventing Gender Based Violence and Violence Against Children

1. Background

The purpose of these Codes of Conduct and Action Plan for Implementing ESHS and OHS Standards, and Preventing Gender Based Violence (GBV) and Violence Against Children (VAC) is to introduce a set of key definitions, core Codes of Conduct, and guidelines that:

- i. clearly define obligations on all project staff (including sub-contractors and day workers) with regard to implementing the project's environmental, social, health and safety (ESHS) and occupational health and safety (OHS) requirements, and;
- ii. help prevent, report and address GBV and VAC within the work site and in its immediate surrounding communities.

The application of these Codes of Conduct will help ensure the project meets its ESHS and OHS objectives, as well as preventing and/or mitigating the risks of GBV and VAC on the project and in the local communities.

These Codes of Conduct are to be adopted by those working on the project and are meant to:

- i. create awareness of the ESHS and OHS expectations on the project;
- ii. create common awareness about GBV and VAC and:
 - (a) ensure a shared understanding that they have no place in the project; and,
 - (b) create a clear system for identifying, responding to, and sanctioning GBV and VAC incidents.

Ensuring that all project staff understand the values of the project, understand expectations for all employees, and acknowledge the consequences for violations of these values, will help to create smoother, more respectful and productive project implementation thereby helping ensure that the project's objectives will be achieved.

2. Definitions

The following definitions apply:

Environmental, Social, Health and Safety (ESHS): an umbrella term covering issues related to the impact of the project on the environment, communities and workers.

Occupational Health and Safety (OHS): Occupational health and safety is concerned with protecting the safety, health and welfare of people engaged in work or employment. The enjoyment of these standards at the highest levels is a basic human right that should be accessible by each and every worker.

Gender-Based Violence (GBV): is an umbrella term for any harmful act that is perpetrated against a person's will and **that is based on socially ascribed (i.e. gender) differences between males and females**. It includes acts that inflict physical, sexual or mental harm or suffering, threats of such acts, coercion, and other deprivations of liberty. These acts can occur in public or in private. The term GBV is

used to underscore systemic inequality between males and females (which exists in every society in the world) and acts as a unifying and foundational characteristic of most forms of violence perpetrated against women and girls. The 1993 United Nations Declaration on the

Elimination of Violence against Women defines violence against women as "any act of gender-based violence that results in, or is likely to result in, physical, sexual or psychological harm or suffering to women." The six core types of GBV are:

- **Rape**: non-consensual penetration (however slight) of the vagina, anus or mouth with a penis, other body part, or an object.
- Sexual Assault: any form of non-consensual sexual contact that does not result in or include penetration. Examples include: attempted rape, as well as unwanted kissing, fondling, or touching of genitalia and buttocks.
 - Sexual Harassment: is unwelcome sexual advances, requests for sexual favours, and other verbal or physical conduct of a sexual nature. Sexual harassment is not always explicit or obvious, it can include implicit and subtle acts but always involves a power and gender dynamic in which a person in power uses their position to harass another based on their gender. Sexual conduct is unwelcome whenever the person subjected to it considers it unwelcome (e.g. looking somebody up and down; kissing, howling or smacking sounds; hanging around somebody; whistling and catcalls; in some instances, giving personal gifts).
 - Sexual Favours: is a form of sexual harassment and includes making promises of favourable treatment (e.g. promotion) or threats of unfavourable treatment (e.g. loss of job) dependent on sexual acts—or other forms of humiliating, degrading or exploitative behaviour.
- **Physical Assault**: an act of physical violence that is not sexual in nature. Examples include: hitting, slapping, choking, cutting, shoving, burning, shooting or use of any weapons, acid attacks or any other act that results in pain, discomfort or injury.
- Forced Marriage: the marriage of an individual against her or his will.
- Denial of Resources, Opportunities or Services: denial of rightful access to economic resources/assets or livelihood opportunities, education, health or other social services (e.g. a widow prevented from receiving an inheritance, earnings forcibly taken by an intimate partner or family member, a woman prevented from using contraceptives, a girl prevented from attending school, etc.).
- Psychological / Emotional Abuse: infliction of mental or emotional pain or injury. Examples
 include: threats of physical or sexual violence, intimidation, humiliation, forced isolation,
 stalking, harassment, unwanted attention, remarks, gestures or written words of a sexual and/or
 menacing nature, destruction of cherished things, etc.

113

¹ It is important to note that women and girls disproportionately experience violence; overall 35 percent of women worldwide have faced physical or sexual violence (WHO, Global and regional estimates of violence against women: prevalence and health effects of intimate partner violence and non-partner sexual violence, 2013). Some men and boys also face violence based on their gender and unequal power relationships.

Violence Against Children (VAC): is defined as physical, sexual, emotional and/or psychological harm, neglect or negligent treatment of minor children (i.e. under the age of 18), including exposure to such harm,² that results in actual or potential harm to the child's health, survival, development or dignity in the context of a relationship of responsibility, trust or power. This includes using children for profit, labour³, sexual gratification, or some other

personal or financial advantage. This also includes other activities such as using computers, mobile phones, video and digital cameras or any other medium to exploit or harass children or to access child pornography.

Grooming: are behaviours that make it easier for a perpetrator to procure a child for sexual activity. For example, an offender might build a relationship of trust with the child, and then seek to sexualize that relationship (for example by encouraging romantic feelings or exposing the child to sexual concepts through pornography).

Online Grooming: is the act of sending an electronic message with indecent content to a recipient who the sender believes to be a minor, with the intention of procuring the recipient to engage in or submit to sexual activity with another person, including but not necessarily the sender.⁴

Accountability Measures: are the measures put in place to ensure the confidentiality of survivors and to hold contractors, consultants and the client responsible for instituting a fair system of addressing cases of GBV and VAC.

Contractors Environmental and Social Management Plan (CESMP): the plan prepared by the contractor outlining how they will implement the works activities in accordance with the project's environmental and social management plan (ESMP).

Child: is used interchangeably with the term 'minor' and refers to a person under the age of 18. This is in accordance with Article 1 of the United Nations Convention on the Rights of the Child.

Child Protection (CP): is an activity or initiative designed to protect children from any form of harm, particularly arising from VAC.

Consent: is the informed choice underlying an individual's free and voluntary intention, acceptance or agreement to do something. No consent can be found when such acceptance or agreement is obtained through the use of threats, force or other forms of coercion, abduction, fraud, deception, or misrepresentation. In accordance with the United Nations Convention on the Rights of the Child, the World Bank considers that consent cannot be given by children under the age of 18, even in the event that national legislation of the country into which the Code of Conduct is introduced has a lower age.⁵ Mistaken belief regarding the age of the child and consent from the child is not a defence.

-

² Exposure to GBV is also considered VAC.

³ The employment of children must comply with all relevant local legislation, including labor laws in relation to child labor and World Bank's safeguard policies on child labor and minimum age. They must also be able to meet the project's Occupational Health and Safety competency standards.

⁴ For example, the Vanuatu Criminal Code Act 1995, Division 474 (telecommunications offences, subdivision C).

⁵ For example, under Article 97 Criminal consolidation act for age of legal consent in Vanuatu, sexual activity with any child under the age of 15 years for heterosexual conduct and 18 years for same sex conduct is prohibited (http://tinyurl.com/vu-consent). However, the World Bank follows the United Nations for the age of consent (18 years) so this applies on World Bank financed projects.

Consultant: is as any firm, company, organization or other institution that has been awarded a contract to provide consulting services to the project, and has hired managers and/or employees to conduct this work.

Contractor: is any firm, company, organization or other institution that has been awarded a contract to conduct

infrastructure development works for the project and has hired managers and/or employees to conduct this work. This also includes sub-contractors hired to undertake activities on behalf of the contractor.

Employee: is any individual offering labour to the contractor or consultant within country on or off the work site, under a formal or informal employment contract or arrangement, typically, but not necessarily (e.g. including unpaid interns and volunteers), in exchange for a salary, with no responsibility to manage or supervise other employees.

GBV and VAC Allegation Procedure: is the prescribed procedure to be followed when reporting incidents of GBV or VAC.

GBV and VAC Codes of Conduct: The Codes of Conduct adopted for the project covering the commitment of the company, and the responsibilities of managers and individuals with regards to GBV and VAC.

GBV and VAC Compliance Team (GCCT): a team established by the project to address GBV and VAC issues.

Grievance Redress Mechanism (GRM): is the process established by a project to receive and address complaints.

Manager: is any individual offering labour to the contractor or consultant, on or off the work site, under a formal or informal employment contract and in exchange for a salary, with responsibility to control or direct the activities of a contractor's or consultant's team, unit, division or similar, and to supervise and manage a pre-defined number of employees.

Perpetrator: the person(s) who commit(s) or threaten(s) to commit an act or acts of GBV or VAC.

Response Protocol: is the mechanisms set in place to respond to cases of GBV and VAC (see Section 4.7 Response Protocol).

Survivor/Survivors: the person(s) adversely affected by GBV or VAC. Women, men and children can be survivors of GBV; children can be survivors of VAC.

Work Site: is the area in which infrastructure development works are being conducted, as part of the project. Consulting assignments are considered to have the areas in which they are active as their work sites.

Work Site Surroundings: is the 'Project Area of Influence' which are any area, urban or rural, directly affected by the project, including all human settlements found on it.

3. Codes of Conduct

This chapter presents three Codes of Conduct for use:

- i) Company Code of Conduct: Commits the company to addressing GBV and VAC issues;
- ii) **Manager's Code of Conduct:** Commits managers to implementing the Company Code of Conduct, as well as those signed by individuals; and,
- iii) **Individual Code of Conduct:** Code of Conduct for everyone working on the project, including managers.

Company Code of Conduct

Implementing ESHS and OHS Standards

Preventing Gender Based Violence and Violence Against Children

The company is committed to ensuring that the project is implemented in such a way which minimizes any negative impacts on the local environment, communities, and its workers. This will be done by respecting the environmental, social, health and safety (ESHS) standards, and ensuring appropriate occupational health and safety (OHS) standards are met. The company is also committed to creating and maintaining an environment in which gender-based violence (GBV) and violence against children (VAC) have no place, and where they will not be tolerated by any employee, sub-contractors, supplier, associate, or representative of the company.

Therefore, to ensure that all those engaged in the project are aware of this commitment, the company commits to the following core principles and minimum standards of behaviour that will apply to all company employees, associates, and representatives, including sub-contractors and suppliers, without exception:

General

- 1. The company—and therefore all employees, associates, representatives, sub-contractors and suppliers—commits to complying with all relevant national laws, rules and regulations.
- 2. The company commits to full implementing its 'Contractors Environmental and Social Management Plan' (CESMP).
- 3. The company commits to treating women, children (persons under the age of 18), and men with respect regardless of race, colour, language, religion, political or other opinion, national, ethnic or social origin, property, disability, birth or other status. Acts of GBV and VAC are in violation of this commitment.
- 4. The company shall ensure that interactions with local community members are done with respect and non-discrimination.
- 5. Demeaning, threatening, harassing, abusive, culturally inappropriate, or sexually provocative language and behaviour are prohibited among all company employees, associates, and its representatives, including sub-contractor by s and suppliers.
- 6. The company will follow all reasonable work instructions (including regarding environmental and social norms).
- 7. The company will protect and ensure proper use of property (for example, to prohibit theft, carelessness or waste).

Health and Safety

8. The company will ensure that the project's occupational health and safety (OHS) Management Plan is effectively implemented by company staff, as well as sub-contractors and suppliers.

- 9. The company will ensure that all those on-site wears prescribed and appropriate personal protective equipment, preventing avoidable accidents and reporting conditions or practices that pose a safety hazard or threaten the environment.
- 10. The company will:
 - i) prohibit the use of alcohol during work activities.
 - ii) prohibit the use of narcotics or other substances which can always impair faculties.
- 11. The company will ensure that adequate sanitation facilities are available on site and at any worker accommodations provided to those working on the project.

Gender Based Violence and Violence Against Children

- 12. Acts of GBV or VAC constitute gross misconduct and are therefore grounds for sanctions, which may include penalties and/or termination of employment, and if appropriate referral to the Police for further action.
- 13. All forms of GBV and VAC, including grooming are unacceptable, regardless of whether they take place on the work site, the work site surroundings, at worker's camps or within the local community.
 - Sexual Harassment—for instance, making unwelcome sexual advances, requests for sexual favours, and other verbal or physical conduct, of a sexual nature, including subtle acts of such behaviour, is prohibited.
 - Sexual favours —for instance, making promises or favourable treatment dependent on sexual acts—or other forms of humiliating, degrading or exploitative behaviour are prohibited.
- 14. Sexual contact or activity with children under 18—including through digital media—is prohibited. Mistaken belief regarding the age of a child is not a defence. Consent from the child is also not a defence or excuse.
- 15. Unless there is full consent⁶ by all parties involved in the sexual act, sexual interactions between the company's employees (at any level) and members of the communities surrounding the work place are prohibited. This includes relationships involving the withholding/promise of actual provision of benefit (monetary or non-monetary) to community members in exchange for sex—such sexual activity is considered "non-consensual" within the scope of this Code.
- 16. In addition to company sanctions, legal prosecution of those who commit acts of GBV or VAC will be pursued if appropriate.

⁶ **Consent** is defined as the informed choice underlying an individual's free and voluntary intention, acceptance or agreement to do something. No consent can be found when such acceptance or agreement is obtained through the use of threats, force or other forms of coercion, abduction, fraud, deception, or misrepresentation. In accordance with the United Nations Convention on the Rights of the Child, the World Bank considers that consent cannot be given by children under the age of 18, even in the event that national legislation of the country into which the Code of Conduct is introduced has a lower age. Mistaken belief regarding the age of the child and consent from the child is not a defense.

- 17. All employees, including volunteers and sub-contractors are highly encouraged to report suspected or actual acts of GBV and/or VAC by a fellow worker, whether in the same company or not. Reports must be made in accordance with project's GBV and VAC Allegation Procedures.
- 18. Managers are required to report and take action of suspected or actual acts of GBV and/or VAC as they have a responsibility to uphold company commitments and hold their direct reports responsible.

Implementation

To ensure that the above principles are implemented effectively the company commits to ensuring that:

- 19. All managers sign the project's 'Manager's Code of Conduct' detailing their responsibilities for implementing the company's commitments and enforcing the responsibilities in the 'Individual Code of Conduct'.
- 20. All employees sign the project's 'Individual Code of Conduct' confirming their agreement to comply with ESHS and OHS standards, and not to engage in activities resulting in GBV or VAC.
- 21. Displaying the Company and Individual Codes of Conduct prominently and in clear view at workers' camps, offices, and in in public areas of the work space. Examples of areas include waiting, rest and lobby areas of sites, canteen areas and health clinics.
- 22. Ensure that posted and distributed copies of the Company and Individual Codes of Conduct are translated into the appropriate language of use in the work site areas as well as for any international staff in their native language.
- 23. An appropriate person is nominated as the company's 'Focal Point' for addressing GBV and VAC issues, including representing the company on the GBV and VAC Compliance Team (GCCT) which is comprised of representatives from the client, contractor(s), the supervision consultant, and local service provider(s).
- 24. Ensuring that an effective GBV and VAC Action Plan is developed in consultation with the GCCT which includes as a minimum:
 - i) GBV and VAC Allegation Procedure to report GBV and VAC issues through the project Grievance Redress Mechanism (Section 4.3 Action Plan);
 - ii) **Accountability Measures** to protect confidentiality of all involved (Section 4.4 Action Plan); and,
 - iii) **Response Protocol** applicable to GBV and VAC survivors and perpetrators (Section 4.7 Action Plan).
- 25. That the company effectively implements the agreed final GBV and VAC Action Plan, providing feedback to the GCCT for improvements and updates as appropriate.
- 26. All employees attend an induction training course prior to commencing work on site to ensure they are familiar with the company's commitments to ESHS and OHS standards, and the project's GBV and VAC Codes of Conduct.

27. All employees attend a mandatory training course once a month for the duration of the contract starting from the first induction training prior to commencement of work to reinforce the understanding of the project's ESHS and OHS standards and the GBV and VAC Code of Conduct.

I do hereby acknowledge that I have read the foregoing Company Code of Conduct, and on behalf of the company agree to comply with the standards contained therein. I understand my role and responsibilities to support the project's OHS and ESHS standards, and to prevent and respond to GBV and VAC. I understand that any action inconsistent with this Company Code of Conduct or failure to take action mandated by this Company Code of Conduct may result in disciplinary action.

Manager's Code of Conduct

Implementing ESHS and OHS Standards

Preventing Gender Based Violence and Violence Against Children

Managers at all levels have a responsibility to uphold the company's commitment to implementing the ESHS and OHS standards, and preventing and addressing GBV and VAC. This means that managers have an acute responsibility to create and maintain an environment that respects these standards, and prevents GBV and VAC. Managers need to support and promote the implementation of the Company Code of Conduct. To that end, managers must adhere to this Manager's Code of Conduct and also sign the Individual Code of Conduct. This commits them to supporting the implementation of the CESMP and the OHS Management Plan, and developing systems that facilitate the implementation of the GBV and VAC Action Plan. They need to maintain a safe workplace, as well as a GBV-free and VAC-free environment at the workplace and in the local community. These responsibilities include but are not limited to:

Implementation

- 1. To ensure maximum effectiveness of the Company and Individual Codes of Conduct:
 - i) Prominently displaying the Company and Individual Codes of Conduct in clear view at workers' camps, offices, and in public areas of the work space. Examples of areas include waiting, rest and lobby areas of sites, canteen areas and health clinics.
 - ii) Ensuring all posted and distributed copies of the Company and Individual Codes of Conduct are translated into the appropriate language of use in the work site areas as well as for any international staff in their native language.
- 2. Verbally and in writing explain the Company and Individual Codes of Conduct to all staff.
- 3. Ensure that:
 - i) All direct reports sign the 'Individual Code of Conduct', including acknowledgment that they have read and agree with the Code of Conduct.
 - ii) Staff lists and signed copies of the Individual Code of Conduct are provided to the OHS Manager, the GCCT, and the client.
 - iii) Participate in training and ensure that staff also participate as outlined below.
 - iv) Put in place a mechanism for staff to:
 - (a) report concerns on ESHS or OHS compliance; and,
 - (b) confidentially report GBV or VAC incidents through the Grievance Redress Mechanism (GRM)

v) Staff are encouraged to report suspected or actual ESHS, OHS, GBV or VAC issues, emphasizing the staff's responsibility to the Company and the country hosting their employment, and emphasizing the respect for confidentiality.

In compliance with applicable laws and to the best of your abilities, prevent perpetrators of sexual exploitation and abuse from being hired, re-hired or deployed. Use background and criminal reference checks for all employees.

- 4. Ensure that when engaging in partnership, sub-contractor, supplier or similar agreements, these agreements:
 - i) Incorporate the ESHS, OHS, GBV and VAC Codes of Conduct as an attachment.
 - ii) Include the appropriate language requiring such contracting entities and individuals, and their employees and volunteers, to comply with the Individual Codes of Conduct.
 - iii) Expressly state that the failure of those entities or individuals, as appropriate, to ensure compliance with the ESHS and OHS standards, take preventive measures against GBV and VAC, to investigate allegations thereof, or to take corrective actions when GBV or VAC has occurred, shall not only constitute grounds for sanctions and penalties in accordance with the Individual Codes of Conduct but also termination of agreements to work on or supply the project.
- 5. Provide support and resources to the GCCT to create and disseminate internal sensitization initiatives through the awareness-raising strategy under the GBV and VAC Action Plan.
- 6. Ensure that any GBV or VAC issue warranting Police action is reported to the Police, the client and the World Bank immediately.
- 7. Report and act according to the response protocol (Section 4.7 Response Protocol) any suspected or actual acts of GBV and/or VAC as managers have a responsibility to uphold company commitments and hold their direct reports responsible.
- 8. Ensure that any major ESHS or OHS incidents are reported to the client and the supervision engineer immediately.

Training

- 9. The managers are responsible to:
 - i) Ensure that the OHS Management Plan is implemented, with suitable training required for all staff, including sub-contractors and suppliers; and,
 - ii) Ensure that staff have a suitable understanding of the CESMP and are trained as appropriate to implement the CESMP requirements.
- 10. All managers are required to attend an induction manager training course prior to commencing work on site to ensure that they are familiar with their roles and responsibilities in upholding the GBV and VAC elements of these Codes of Conduct. This training will be separate from the induction training course required of all employees and will provide managers with the necessary understanding and technical support needed to begin to develop the GBV and VAC Action Plan for addressing GBV and VAC issues.

- 11. Managers are required to attend and assist with the project facilitated monthly training courses for all employees. Managers will be required to introduce the trainings and announce the self-evaluations, including collecting satisfaction surveys to evaluate training experiences and provide advice on improving the effectiveness of training.
- 12. Ensure that time is provided during work hours and that staff prior to commencing work on site attend the mandatory project facilitated induction training on:
 - i) OHS and ESHS; and,
 - ii) GBV and VAC required of all employees.
- 13. During civil works, ensure that staff attend ongoing OHS and ESHS training, as well as the monthly mandatory refresher training course required of all employees to combat increased risk of GBV and VAC.

Response

- 14. Managers will be required to take appropriate actions to address any ESHS or OHS incidents.
- 15. With regard to GBV and VAC:
 - Provide input to the GBV and VAC Allegation Procedures (Section 4.2 Action Plan) and Response Protocol (Section 4.7 Action Plan) developed by the GCCT as part of the final cleared GBV and VAC Action Plan.
 - ii) Once adopted by the Company, managers will uphold the Accountability Measures (Section 4.4 Action Plan) set forth in the GBV and VAC Action Plan to maintain the confidentiality of all employees who report or (allegedly) perpetrate incidences of GBV and VAC (unless a breach of confidentiality is required to protect persons or property from serious harm or where required by law).
 - iii) If a manager develops concerns or suspicions regarding any form of GBV or VAC by one of his/her direct reports, or by an employee working for another contractor on the same work site, s/he is required to report the case using the GRM.
 - iv) Once a sanction has been determined, the relevant manager(s) is/are expected to be personally responsible for ensuring that the measure is effectively enforced, within a maximum timeframe of <u>14 days</u> from the date on which the decision to sanction was made
 - v) If a Manager has a conflict of interest due to personal or familial relationships with the survivor and/or perpetrator, he/she must notify the respective company and the GCCT. The Company will be required to appoint another manager without a conflict of interest to respond to complaints.
 - vi) Ensure that any GBV or VAC issue warranting Police action is reported to the Police, the client and the World Bank immediately
- 16. Managers failing address ESHS or OHS incidents, or failing to report or comply with the GBV and VAC provisions may be subject to disciplinary measures, to be determined and enacted by

the company's CEO, Managing Director or equivalent highest-ranking manager. Those measures may include:

- i) Informal warning.
- ii) Formal warning.
- iii) Additional Training.
- iv) Loss of up to one week's salary.
- v) Suspension of employment (without payment of salary), for a minimum period of 1 month up to a maximum of 6 months.
- vi) Termination of employment.
- 17. Ultimately, failure to effectively respond to ESHS, OHS, GBV and VAC cases on the work site by the company's managers or CEO may provide grounds for legal actions by authorities.

I do hereby acknowledge that I have read the foregoing Manager's Code of Conduct, do agree to comply with the standards contained therein and understand my roles and responsibilities to prevent and respond to ESHS, OHS, GBV and VAC requirements. I understand that any action inconsistent with this Manager's Code of Conduct or failure to take action mandated by this Manager's Code of Conduct may result in disciplinary action.

Individual Code of Conduct

Implementing ESHS and OHS Standards

Preventing Gender Based Violence and Violence Against Children

I, ______, acknowledge that adhering to environmental, social health and safety (ESHS) standards, following the project's occupational health and safety (OHS) requirements, and preventing gender based violence (GBV) and violence against children (VAC) is important.

The company considers that failure to follow ESHS and OHS standards, or to partake in GBV or VAC activities—be it on the work site, the work site surroundings, at workers' camps, or the surrounding communities—constitute acts of gross misconduct and are therefore grounds for sanctions, penalties or potential termination of employment. Prosecution by the Police of those who commit GBV or VAC may be pursued if appropriate.

I agree that while working on the project I will:

- 1. Attend and actively partake in training courses related to ESHS, OHS, HIV/AIDS, GBV and VAC as requested by my employer.
- 2. Will wear my personal protective equipment (PPE) at all times when at the work site or engaged in project related activities.
- 3. Take all practical steps to implement the contractor's environmental and social management plan (CESMP).
- 4. Implement the OHS Management Plan.
- 5. Adhere to a zero-alcohol policy during work activities, and refrain from the use of narcotics or other substances which can impair faculties at all times.
- 6. Consent to Police background check.
- 7. Treat women, children (persons under the age of 18), and men with respect regardless of race, colour, language, religion, political or other opinion, national, ethnic or social origin, property, disability, birth or other status.
- 8. Not use language or behaviour towards women, children or men that is inappropriate, harassing, abusive, sexually provocative, demeaning or culturally inappropriate.
- 9. Not engage in sexual harassment—for instance, making unwelcome sexual advances, requests for sexual favours, and other verbal or physical conduct, of a sexual nature, including subtle acts of such behaviour (e.g. looking somebody up and down; kissing, howling or smacking sounds; hanging around somebody; whistling and catcalls; giving personal gifts; making comments about somebody's sex life; etc.).
- 10. Not engage in sexual favours—for instance, making promises or favourable treatment dependent on sexual acts—or other forms of humiliating, degrading or exploitative behaviour.

- 11. Not participate in sexual contact or activity with children—including grooming, or contact through digital media. Mistaken belief regarding the age of a child is not a defence. Consent from the child is also not a defence or excuse.
- 12. Unless there is the full consent⁷ by all parties involved, I will not have sexual interactions with members of the surrounding communities. This includes relationships involving the withholding or promise of actual provision of benefit (monetary or non-monetary) to community members in exchange for sex—such sexual activity is considered "non-consensual" within the scope of this Code.
- 13. Consider reporting through the GRM or to my manager any suspected or actual GBV or VAC by a fellow worker, whether employed by my company or not, or any breaches of this Code of Conduct.

With regard to children under the age of 18:

- 14. Wherever possible, ensure that another adult is present when working in the proximity of children.
- 15. Not invite unaccompanied children unrelated to my family into my home, unless they are at immediate risk of injury or in physical danger.
- 16. Not use any computers, mobile phones, video and digital cameras or any other medium to exploit or harass children or to access child pornography (see also "Use of children's images for work related purposes" below).
- 17. Refrain from physical punishment or discipline of children.
- 18. Refrain from hiring children for domestic or other labour below the minimum age of 14 unless national law specifies a higher age, or which places them at significant risk of injury.
- 19. Comply with all relevant local legislation, including labour laws in relation to child labour and World Bank's safeguard policies on child labour and minimum age.
- 20. Take appropriate caution when photographing or filming children (See Annex 2 for details).

Use of children's images for work related purposes

When photographing or filming a child for work related purposes, I must:

- 21. Before photographing or filming a child, assess and endeavour to comply with local traditions or restrictions for reproducing personal images.
- 22. Before photographing or filming a child, obtain informed consent from the child and a parent or guardian of the child. As part of this I must explain how the photograph or film will be used.

⁷ **Consent** is defined as the informed choice underlying an individual's free and voluntary intention, acceptance or agreement to do something. No consent can be found when such acceptance or agreement is obtained through the use of threats, force or other forms of coercion, abduction, fraud, deception, or misrepresentation. In accordance with the United Nations Convention on the Rights of the Child, the World Bank considers that consent cannot be given by children under the age of 18, even in the event that national legislation of the country into which the Code of Conduct is introduced has a lower age. Mistaken belief regarding the age of the child and consent from the child is not a defense.

- 23. Ensure photographs, films, videos and DVDs present children in a dignified and respectful manner and not in a vulnerable or submissive manner. Children should be adequately clothed and not in poses that could be seen as sexually suggestive.
- 24. Ensure images are honest representations of the context and the facts.
- 25. Ensure file labels do not reveal identifying information about a child when sending images electronically.

Sanctions

I understand that if I breach this Individual Code of Conduct, my employer will take disciplinary action which could include:

- 1. Informal warning.
- 2. Formal warning.
- 3. Additional Training.
- 4. Loss of up to one week's salary.
- 5. Suspension of employment (without payment of salary), for a minimum period of 1 month up to a maximum of 6 months.
- 6. Termination of employment.
- 7. Report to the Police if warranted.

I understand that it is my responsibility to ensure that the environmental, social, health and safety standards are met. That I will adhere to the occupational health and safety management plan. That I will avoid actions or behaviours that could be construed as GBV or VAC. Any such actions will be a breach this Individual Code of Conduct. I do hereby acknowledge that I have read the foregoing Individual Code of Conduct, do agree to comply with the standards contained therein and understand my roles and responsibilities to prevent and respond to ESHS, OHS, GBV and VAC issues. I understand that any action inconsistent with this Individual Code of Conduct or failure to take action mandated by this Individual Code of Conduct may result in disciplinary action and may affect my ongoing employment.

4. GBV and VAC Action Plan

4.1 The GBV and VAC Compliance Team

The project shall establish a 'GBV and VAC Compliance Team' (GCCT). The GCCT will include, as appropriate to the project, at least four representatives ('Focal Points') as follows:

- i) A safeguards specialist from the client;
- ii) The occupational health and safety manager from the contractor⁸, or someone else tasked with the responsibility for addressing GBV and VAC with the time and seniority to devote to the position;
- iii) The supervision consultant; and,
- iv) A representative from a local service provider with experience in GBV and VAC (the 'Service Provider').

It will be the duty of the GCCT with support from the management of the contractor to inform workers about the activities and responsibilities of the GCCT. To effectively serve on the GCCT, members must undergo training by the local service provider prior to the commencement of their assignment to ensure that they are sensitized on GBV and Child Protection.

The GCCT will be required to:

- i) Approve any changes to the **GBV and VAC Codes of Conduct** contained in this document, with clearances from the World Bank for any such changes.
- ii) Prepare the GBV and VAC Action Plan reflecting the Codes of Conduct which includes:
 - (a) **GBV and VAC Allegation Procedures** (See 4.2)
 - (b) **Accountability Measures** (See 4.4)
 - (c) An Awareness raising Strategy (See 4.6)
 - (d) A Response Protocol (See 4.7)
- iii) Obtain approval of the GBV and VAC Action Plan by the contractor's management;
- iv) Obtain client and World Bank clearances for the GBV and VAC Action Plan prior to full mobilization;
- v) Receive and monitor resolutions and sanctions with regard to complaints received related to GBV and VAC associated with the project; and,
- vi) Ensure that GBV and VAC statistics in the GRM are up to date and included in the regular project reports.

The GCCT shall hold quarterly update meetings to discuss ways to strengthen resources and GBV and VAC support for employees and community members.

⁸ Where there are multiple contractors working on the project each shall nominate a representative as appropriate.

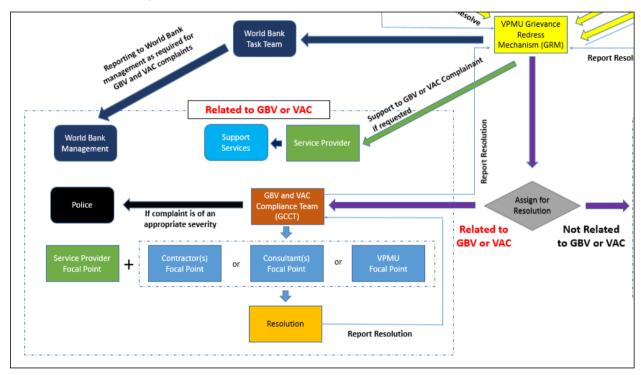

4.2 Making Complaints: GBV and VAC Allegation Procedures

All staff, volunteers, consultants and sub-contractors are encouraged to report suspected or actual GBV or VAC cases. Managers are required to report suspected or actual GBV and/or VAC cases as they have responsibilities to uphold company commitments and they hold their direct reports accountable for complying with the Individual

The project will provide information to employees and the community on how to report cases of GBV and VAC Code of Conduct breaches through the Grievance Redress Mechanism (GRM). The GCCT will follow up on cases of GBV, VAC and Code of Conduct breaches reported through the GRM.

4.3 Addressing Complaints about GBV or VAC

The figure below shows the process for addressing complaints based on the example of the Vanuatu Aviation Investment Project (VAIP).

Note: VPMU is the Vanuatu Project Management Unit (VPMU) responsible for the implementation of VAIP.

GRM

The project operates a grievance redress mechanism (GRM) which is managed by a designated GRM operator with the project management unit. Reports of GBV or VAC, other complaints, or other concerns may be submitted online, via telephone or mail, or in person.

All complaints regarding GBV and VAC must immediately be reported to the World Bank task team by the GRM operator.

The GRM operator will refer complaints related to GBV or VAC to the GCCT to resolve them. In accordance with the GBV and VAC Action Plan, the GCCT through the Service Provider and Focal Point(s) will investigate the complaint and ultimately provide the GRM operator with a resolution to the

complaint, or the Police if necessary. The victim's confidentiality should also be kept in mind when reporting any incidences to the Police.

The GRM operator will, upon resolution, advise the complainant of the outcome, unless it was made anonymously. Complaints made to managers or the Service Provider will be referred by them to the GRM for processing.

If the complaint to the GRM is made by a survivor or on behalf of a survivor, the complainant will be directly referred to the service provider to receive support services while the GCCT investigates the complaint in parallel.

Service Provider

The Service Provider is a local organization which has the experience and ability to support survivors of GBV or VAC. The client, the contractor(s) and consultant must establish a working relationship with the Service Provider, so that GBV and VAC cases can safely be referred to them. The Service Provider will also provide support and guidance to the GBV and VAC Focal Points as necessary. The Service Provider will have a representative on the GCCT and be involved in resolving complaints related to GBV or VAC.

GCCT GBV and VAC Focal Points

The GCCT shall confirm that all complaints related to GBV or VAC have been referred to the World Bank by the GRM operator.

The GCCT shall consider all GBV and VAC complaints and agree on a plan for resolution. The appropriate

Focal Point will be tasked with implementing the plan (i.e. issues with contractor's staff will be for the contractor to resolve; consultant's staff the consultant; and client staff the client). The Focal Point will advise the GCCT on resolution, including referral to the Police if necessary. They will be assisted by the Service Provider as appropriate.

All the Focal Points on the GCCT must be trained and empowered to resolve GBV and VAC issues. It is essential that all staff of the GRM and GCCT understand the guiding principles and ethical requirement of dealing with survivors of GBV and VAC. All reports should be kept confidential and referred immediately to the Service Provider represented on the GCCT⁹. In GBV and VAC cases warranting Police action, the Focal Points must appropriately refer the complaint to: (i) the authorities; (ii) the Service Provider; and, (iii) management for further action. The client and the World Bank are to be immediately notified.

4.4 Accountability Measures

All reports of GBV or VAC shall be handled in a confidential manner in order to protect the rights of all involved. The client, contractor and consultant must maintain the confidentiality of employees who notify any acts or threats of violence, and of any employees accused of engaging in any acts or threats of violence (unless a breach of confidentiality is required to protect persons or property from serious harm or where required by law). The contractor and consultant must prohibit discrimination or adverse

⁹ Survivors of GBV and VAC may need access to Police, justice, health, psychosocial, safe shelter and livelihood services to begin on a path of healing from their experience of violence.

action against an employee on the basis of survivor's disclosure, experience or perceived experience of GBV or VAC (see Annex 1 for examples of actions to maintain accountability).

To ensure that survivors feel confident to disclose their experience of GBV or VAC, they can report cases of GBV or VAC through multiple channels: (i) online, (ii) phone, (iii) in-person, (iv) the local service provider, (v) the manager(s), (vi) village councils; or, (vii) the Police. To ensure confidentiality, only the service provider will be privy to information regarding the survivor and only GCCT will primarily point of contact for information and follow up regarding the perpetrator. Only the Service Provider will have access to the name of the survivor.

4.5 Monitoring and Evaluation

The GCCT must monitor the follow up of cases that have been reported and maintain all reported cases in a confidential and secure location. Monitoring must collect the number of cases that have been reported and the share of them that are being managed by Police, NGOs etc.

These statistics shall be reported to the GRM and the Supervision Engineer for inclusion in their reporting.

For any GBV and VAC cases warranting Police action, the client and the World Bank are to be immediately notified.

4.6 Awareness-raising Strategy

It is important to create an Awareness-raising Strategy with activities aimed to sensitize employees on GBV and VAC on the work site and its related risks, provisions of the GBV and VAC Codes of Conduct, GBV and VAC Allegation Procedures, Accountability Measures and Response Protocol. The strategy will be accompanied by a timeline, indicating the various sensitization activities through which the strategy will be implemented and also the related (expected) delivery dates. Awareness-raising activities should be linked with trainings provided by the Service Provider.

4.7 Response Protocol

The GCCT will be responsible for developing a written response ¹⁰ protocol to meet the project requirements, in accordance to national laws and protocols. The response protocol must include mechanisms to notify and respond to perpetrators in the workplace (See 4.9 for Perpetrator Policy and Response). The response protocol will include the GRM process to ensure competent and confidential response to disclosures of GBV and VAC. An employee who discloses a case of GBV or VAC in the workplace shall be referred to the GRM for reporting.

4.8 Survivor Support Measures

It is essential to appropriately respond to the survivor's complaint by respecting the survivor's choices to minimize the potential for re-traumatization and further violence against the survivor. Refer the survivor to the Service Provider to obtain appropriate support services in the community—including medical and psychosocial support, emergency accommodation, security including Police protection and livelihood support—by facilitating contact and coordination with these services. The client, contractor

¹⁰ Develop appropriate protocol for written recording of GBV issues and VAC raised in case the notes are subpoenaed. Develop processes for record keeping including activities undertaken by the GCCT.

or consultant may, where feasible, provide financial and other supports to survivors of GBV or VAC for these services (see Annex 1 for examples of financial support).

If the survivor is an employee, in order to ensure the safety of the survivor, and the workplace in general, the client, contractor or consultant, in consultation with the survivor, will assess the risk of ongoing abuse to the survivor and in the workplace. Reasonable adjustments will be made to the survivor's work schedule and work environment as deemed necessary (see Annex 1 for examples of safety measures). The employer will provide adequate leave to survivors seeking services after experiencing violence (see Annex 1 for details).

4.9 Perpetrator Policy and Response

Encourage and accept notification through the GRM from employees and community members about perpetrators in the workplace. Through the GCCT and/or the Service Provider, oversee the investigation of these grievances, ensuring procedural fairness for the accused, and within the local laws. If an employee has breached the Code of Conduct, the employer will take action which could include:

- Undertake disciplinary action up in accordance with sanctions in the GBV and VAC Codes of Conduct;
- ii) Report the perpetrator to the Police as per local legal paradigms; and/or
- iii) If feasible, provide or facilitate counselling for the perpetrator.

5.0 Sanctions

In accordance with the Code of Conduct, any employee confirmed as a GBV or VAC perpetrator shall be considered for disciplinary measures in line with sanctions and practices as agreed in the Individual Code of Conduct (see Annex 1 for examples of sanctions). It is important to note that, for each case, disciplinary sanctions are intended to be part of a process that is entirely internal to the employer, is placed under the full control and responsibility of its managers, and is conducted in accordance with the applicable national labour legislation.

Such process is expected to be fully independent from any official investigation that competent authorities (e.g. Police) may decide to conduct in relationship to the same case, and in accordance with the applicable national law. Similarly, internal disciplinary measures that the employer's managers may decide to enact are meant to be separate from any charges or sanctions that the official investigation may result into (e.g. monetary fines, detention etc.).

Annex 1 - Potential Procedures for Addressing GBV and VAC

Accountability Measures to maintain confidentiality can be achieved through the following actions:

- 1. Inform all employees that confidentiality of GBV/VAC survivors' personal information is of utmost importance.
- 2. Provide the GCCT with training on empathetic and non-judgmental listening.
- 3. Take disciplinary action, including and up to dismissal, against those who breach survivor's confidentiality (this is unless a breach of confidentiality is necessary to protect the survivor or another person from serious harm, or where required by law).

GBV and **VAC** Allegation Procedures should specify:

- 1. Who survivors can seek information and assistance from.
- 2. The process for community members and employees to lodge a complaint through the GRM should there be alleged GBV or VAC.
- 3. The mechanism for how community members and employees can escalate a request for support or notification of violence if the process for reporting is ineffective due to unavailability or non-responsiveness, or if the employee's concern in not resolved.

Financial and Other Supports to survivors can include:

- 1. No/low interest loans.
- 2. Salary advances.
- 3. Direct payment of medical costs.
- 4. Coverage of all medical costs related specifically to the incident.
- 5. Upfront payments for medical costs to later be recouped from the employee's health insurance.
- 6. Providing or facilitating access to childcare.
- 7. Providing security upgrades to the employee's home.
- 8. Providing safe transportation to access support services or to and from accommodation.

Based on the rights, needs and wishes of the survivor, survivor support measures to ensure the safety of the survivor who is an employee can include¹¹:

- 1. Changing the perpetrator or survivor's span of hours or pattern of hours and/or shift patterns.
- 2. Redesigning or changing the perpetrator or survivor's duties.
- 3. Changing the survivor's telephone number or email address to avoid harassing contact.

¹¹ It is critical that a survivor centered approach be adopted. The survivor should be fully involved in the decision making. Except for exceptional circumstances the perpetrator should be required to take appropriate actions to accommodate the survivor (e.g. move, change hours, etc.), rather than the survivor changing.

- 4. Relocating the survivor or perpetrator to another work site/ alternative premises.
- 5. Providing safe transportation to and from work for a specified period.
- 6. Supporting the survivor to apply for an Interim Protection Order or referring them to appropriate support.
- 7. Taking any other appropriate measures including those available under existing provisions for family friendly and flexible work arrangements.

Leave options for survivors that are employees can include:

- An employee experiencing GBV should be able to request paid special leave to attend medical or psychosocial appointments, legal proceedings, relocation to safe accommodation and other activities related to GBV.
- 2. An employee who supports a person experiencing GBV or VAC may take care givers leave, including but not limited to accompanying them to court or hospital, or to take care of children.
- 3. Employees who are employed in a casual capacity may request unpaid special leave or unpaid care givers leave to undertake the activities described above.
- 4. The amount of leave provided will be determine by the individual's situation through consultations with the employee, the management and the GCCT where appropriate.

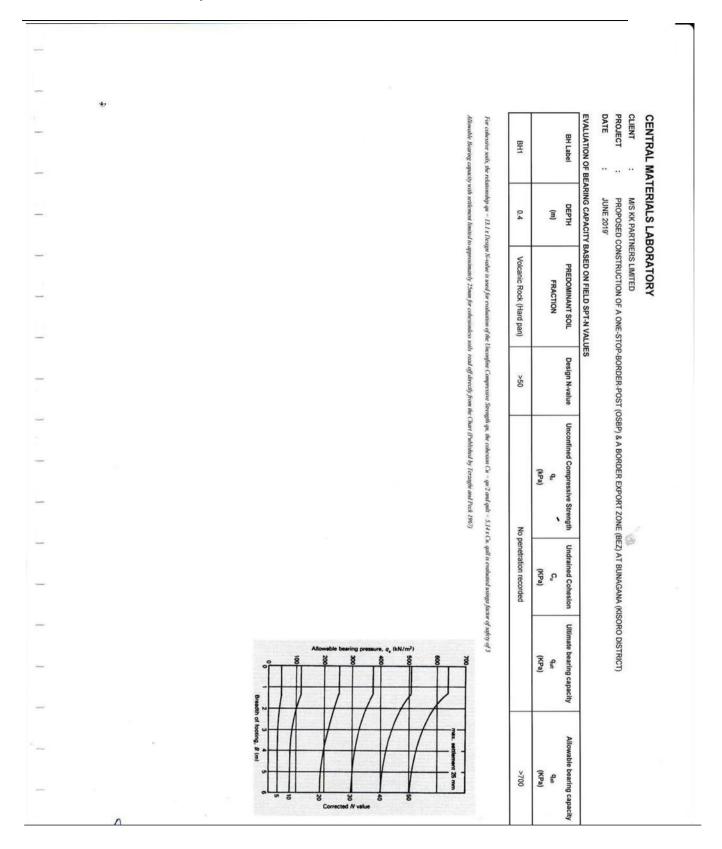

Potential Sanctions to employees who are perpetrators of GBV and VAC include:

- 1. Informal warning
- 2. Formal warning
- 3. Additional Training
- 4. Loss of up to one week's salary.
- 5. Suspension of employment (without payment of salary), for a minimum period of 1 month up to a maximum of 6 months.
- 6. Termination of employment.

Referral to the Police or other authorities as warranted.
